ABSTRACT

This review of factor analyses in research concerned with personality and interest measurement is presented in two main sections. Part I contains the reviews of the analyses, for each of which the following information is provided: (1) the full reference to the article describing the analysis and to the source of the data used if the data were borrowed; (2) the number and description of subjects; (3) a note on any peculiarities or unusual techniques used in the analysis; (4) a description of each of the variables; (5) factor names; (6) the table of factor loadings; (7) intercorrelations of the factors. A supplementary list of analyses omitted from this volume is given at the end of Part I. The factors identified in at least two analyses with sufficient certainty to receive a name are described in Part II. A list of analyses in which the factor appears, its description, and a list of the variables that are the best measures of the factor are given for each. A supplementary list of factors is also provided. Indexes of variables, names and factors conclude the volume. (KM)

ACKNOWLEDGMENTS

The writer wishes to acknowledge the helpful advice on the interpretation of the literature and factors given him by David R. Saunders and Henry N. Ricciuti. Special acknowledgment is also due Sara B. Matlack, Marilyn Laird and Mary Evelyn Runyon for their painstaking job in typing and setting up the copy for reproduction.

INTRODUCTION

Research in the psychology of personality has been tremendously fluent in recent years. Although only a small fraction of this has been quantitative in nature and only a small fraction of this in turn has used the method of factor analysis, nevertheless there are by now so many unrelated factor studies of personality that it is difficult to find which areas are explored and which are not. Since each factor analysis can only explore a relatively small aspect of the mind, and since agreement between analyses is far from perfect, it is necessary to bring many of them together in order to arrive at a comprehensive picture. This survey brings together comparable factor analyses in the field of personality and sets forth their findings in such a way as to be as meaningful as possible to the reader. This volume is parallel in all essential respects to the writer's earlier publication, The Description of Aptitude and Achievement Tests in Terms of Rotated Factors, Psychometric Monograph, No. 5, 1951.

The most exacting part of the task of combining analyses into an integrated whole was studying the interpretations of the factors and cross-identifying factors found in one analysis with those found in other analyses. The interpretations given to factors by the authors of the analyses were found in the majority of cases to stand up well when comparisons were made between analyses. These interpretations were of the utmost assistance to the writer in bringing together and making sense out of approximately 450 factors under consideration. When careful comparisons between analyses and the loadings of tests were made, it was necessary to alter or question some interpretations which had been made by the authors. Most of the alterations of interpretations were slight; a few, however, gave entirely different meanings to the factors. The considerable reliance on subjectivity in making the cross-identifications is discussed in a later section.

For all meaningful factors names were chosen which fitted their interpretation as closely as possible. For the sake of consistency all names chosen for factors are nouns or noun forms. Some authors have intentionally avoided the naming of factors, feeling, with considerable justification, that a name implies a crossidentification or an interpretation with more certainty than is warranted by the data. In such cases numbers or alphabetical code letters were attached to the factors and descriptive interpretations rather than names were offered. For purposes of a survey of this sort, however, names are used advisedly for the specific purpose of suggesting cross-identifications even where these identifications are not established beyond doubt.

The Selection of Analyses.

Because of the difficulty of making cross-identifications among analyses using diverse statistical methods, and because of the large number of factor analyses in the literature, it was found necessary to limit the factor analyses included in this survey in the following three ways:

1. Limitation to analyses concerned with personality and interest measurement. The factor studies in the literature seem to be divided into two general domains; that of aptitude and achievement tests on the one hand, and that of personality or interest ratings, questionnaires, and scales on the other hand. In each domain there has emerged a different set of factors.

The few analyses combining variables from both domains indicate the nature of the separation. Analyses pertinent here are Analyses BrA, CaG, CSA, CT, CW, Gi, and Ho in this book and Re and TG in Psychometric Monograph, No. 5. A few findings are of interest; for example, logical reasoning and poor reading preferences have a loading on Masculinity (CaG-11, 16), mechanical tests go with Surgency and Masculinity (CW-15, 16), and verbal measures have a loading on Self-Sufficiency (Gi-5,7). However, such examples are infrequent

For purposes of brevity, analyses limited to variables in the following categories are mentioned only briefly in the <u>Supplementary Analysis List</u> at the end of <u>Part I:</u> (1) attitudes toward a specific vocation such as teaching, (2) types of humor, (3) types of annoyance, (4) physiological effects, (5) anthropological measurements, (6) Rorschach responses. Some factors in these areas have been shown to be related to personality traits, but in no case yet has the method of factor analysis been given the opportunity to show such a relation because analysts tend to limit themselves to one kind of data in each analysis. Admittedly a narrow definition of personality is being taken by omitting the categories listed above, but findings in those areas do not, at this stage, aid in the interpretation of the personality factors derived from the more direct (though very fallible) types of measurement.

2. Limitation to analyses in which reference factors are been extracted and where there has been rotation toward a simple structure. The great majority of recently published factor analyses fall within this limitation. To preserve the feasibility of combining results by the cross-identification of factors, it was found necessary to avoid the over-complication resulting from the inclusion of analyses using diverse statistical methods. Although the results of the different methods are by no means always unrecognizably different, the extraction of a general factor; for example, produces an effect on the size of factor loadings which considerably hampers comparison with analyses in which no general factor has been extracted.

Likewise use of the centroid method without rotation of axes produces arbitrary factors which can only rarely be cross-identified with those in rotated analyses or other unrotated analyses. In some cases where rotation has been attempted there is still a factor pattern so devoid of structure as to be unuseful in this sort of survey. Such studies are made reference to in the Supplementary Analysis List. Most of the analyses included in this survey use orthogonal rotation of axes, while the rest use oblique rotation. There is some difference of opinion on the respective advantages of the two methods. Orthogonal rotation has the theoretical advantage of simplicity, where each factor may be considered independently of all others. The assumption of orthogonality implies that the simplest structure would be obtained by orthogonal rotation were it not for error variance or special selection of subjects. Oblique rotation, however, has been more popular recently, since it seems likely that psychological variables would only rarely develop independently. Since simple structure is usually best obtained by oblique rotation, the assumption of orthogonality has seemed to be an arbitrary distortion of the facts. The reader will be able to find among the orthogonal analyses described here a number of places where an oblique rotation would clarify the loadings on a factor. This was illustrated in Psychometric Monograph No. 5, but such an illustration will be omitted here for the sake of brevity. However, the differences in the results of orthogonal and oblique rotation are usually sufficiently small that their parallel treatment in a survey of this kind causes no special confusion.

3. Limitation to R-Technique. In Q-technique the factors are defined by clusters of subjects who have similar personality make-up, i.e., who have a similar pattern of endowment in the personality traits measured in the analysis. If rotation to simple structure is possible at all, the factors finally resolved will represent, not personality factors, but certain frequent patterns of factorial endowment. Therefore, these cannot be compared directly with the factors under survey here.

In P-technique the factors are defined by clusters of measurements on a single individual that vary concurrently over a period of time. Most measureable characteristics vary both within and across individuals. These can be studied by both P- and R-technique, and analysis by P-technique has revealed many of the factors found by R-technique. However, fluctuating variables such as those related to hunger would be very proper subjects of P-technique, while food intake of all subjects would have to be very carefully controlled if the individual differences in hunger were to be studied by R-technique. On the other hand characteristics such as intelligence and anthropological measurements are relatively permanent attributes of the organism, and so can be studied most easily by R-technique where use is made of individual differences. It is true that long-term P-technique investigations of such things as hunger and physical size might be successful and very revealing. However, since the number of P-technique studies is still small, the nature of the comparison between the P and R factors is still in doubt. Therefore, it seemed safer as well as a necessary space saver to omit these studies.

Uses of the Survey.

This book has been set up mainly as a reference source on factorial studies rather than as a theoretical exposition or criticism of the conclusions which have been reached through the method of factor analysis. Critical evaluations of the analyses are kept to a minimum, although the dictates of space made it necessary to omit some that were not considered helpful in the understanding of personality factors. Omissions for circumstantial or evaluative reasons are explained above and in the Supplementary Analysis List.

As a reference source this summary is set up so that information can readily be obtained on the following points:

- 1. Factor analysis studies. In Part I, Analyses, the section devoted to each of the analyses includes the reference to the article describing the analysis, variable descriptions, factor loadings, and other information. An explanation of the information provided is given at the start of Part I.
- 2. The nature of each factor and the tests which measure it. In Part II, Factors, the section devoted to each factor includes a description of the factor, a list of the analyses that found it, comment about it, and a list of tests which have high loadings on it. An explanation of the information supplied will be found at the start of Part II.
- 3. The factorial composition of tests. In the back of this volume there is an index of variables (Index 1) which contains not only the references to analyses which include each variable, references to the factors, if any, upon which the variable has a high loading and where all loadings for the variable are summarized. The use of this index is explained at its start.

4. A collection of items and descriptions of variables. Incidental to the factorial studies compiled in this book are the descriptions in Part I of over 1200 different, personality variables.

Media of Personality Measurement.

In the aptitude and achievement domain essentially all measurement is made by means of objective tests. This is possible because aptitude and achievement is concerned with the responses that the subject can make to an easily controlled stimulus. Personality, on the other hand, is concerned not with what the subject can do in response to an easily controlled stimulus, but what he does do in an uncontrolled complex situation.

Below are listed the kinds of media used in the analyses surveyed. The symbols beside each are used in the tables of loadings and in the lists of variables in Part II.

- C = Clinical observation. The data is gathered by direct observation without the use of special scales or by direct measurement using recognized clinical instruments.
- I = Interest inventory. Self-response inventories or single items asking about interests.
- J = Attitude scale. Self-response inventories, scales or single item questions asking about attitudes.
- Q = Personality questionnaire Self-response questionnaires or single items asking about one's habitual behavior patterns.
- R = Behavior rating. Quantitative ratings of specific types of behavior made by one or more observers.
- T = Objective test score.

Cattell summarized both factorial and intercorrelation studies of personality factors in 1946. His method of surveying was to summarize each measurement medium separately and then to indicate the likeness of the factors found in each. In this book all media are treated together, but are marked by the above letter symbols. In Part II it will be seen that about one third of the factors arise from a single medium, the rest from combinations of 2, 3, or 4 media. Unfortunately, a large majority of the analyses deal with one medium only. This means that cross-identification between many analyses had to be made on psychological grounds alone without the benefit of overlapping variables. Factor Pe affords a good example of where one analysis, SaB, serves well in bridging the R and Q media. In that same factor a group of T variables from Analysis BrA afford an example of a purely psychological cross-identification.

Comparison of Personality with Aptitude-Achievement Domains.

Although the sheer number and size of analyses of personality measurements is, perhaps, only a little smaller than that of aptitude-achievement measurements, the personality domain remains a good deal less well described. The principal

Cattell, R. B. Description and Measurement of Personality. World Book Co., Yonkers-on-Hudson, N. Y., 1946, Pp. xx plus 602.

reason for this is that the instruments for measuring personality are less good than those for measuring aptitude-achievement. It is not necessary to decide whether this is because personality is more difficult to measure or whether less effort has been spent on trying to measure it, or both. To improve the situation, it will be necessary either (1) to learn better how to compare the measurements made in the different media or (2) to devise a sufficient variety of objective personality tests. Cattell, in spite of some errors and misinterpretations, is outstanding for his valiant strides in both of these directions. His summary of 1946, his Analysis CSA, and Saunder's Analysis SaB show how the same factors are showing up in the different media. His work described in Analyses CaD, CaF, CaG, CM, and CT show advances in the measurement of personality by objective tests. In these studies, however, it has been very difficult not only to cross-identify the test factors with the factors found in other media, but also to interpret the test factors within their own medium.

In the introduction to <u>Psychometric Monograph</u>, No. 5 a section was devoted to a discussion of genetic and experiential factors. The point was made that the aptitude-achievement domain, as its name implies, included factors defining a continuum from almost purely genetic to almost purely experiential. This point and all of the discussion of that section is equally pertinent to the Personality domain. Among the personality factors at least a considerable part of the continuum is represented, but we have no way of knowing very accurately where upon it any factor should be placed. <u>Emotionality</u> is a factor that probably lies close to the genetic end, while <u>Interest in Science</u> must lie close to the experiential end.

Another section of the introduction to Psychometric Monograph, No. 5 discussed . A parsimonious hypothesis of factorial structure. The point was made that there is insufficient evidence to support the assertion that there exists a hierarchy of factors, i.e., first-order or primary factors that belong to a given second-order factor and lower-order factors into which the first-order factors may be split. The conclusion is reached that a more proper hypothesis at this stage is to suppose that mental structure contains a rather large number of frequently overlapping, causally unrelated factors, which vary greatly in comprehensiveness and nature of origin. Although a few analyses investigate a limited area (BT, CT, Kr, RTB, and St), in no instance has any investigator reported an analysis designed to find the subordinate parts of or designed to make a detailed study of any single previously separated personality factor. On the other hand, there have been several studies aimed in the opposite direction, that of analyzing factor scores. Analyses Lo, No, and ThB analyze Guilford's factor scores. The resulting factors are not too clear, but, 'in any case, it can be said that no convincing second=order factor was found. Analysis BaA goes one step further; it analyzes the factors found in Analysis ThB. The resulting "third-order" factors make some psychological sense and can be likened even to some of the Trequently found "first-order" factors. However, no identifications will be risked here.

Cross-Identification.

Unfortunately the interpretation of factors on the basis of the amount of evidence frequently afforded is a matter of very uncertain judgment. For this reason, although the uncertain interpretations were the ones which required

lbid.

meet thought and have at least a fair amount of evidence supporting them, the writer feels that they are tentative. As a warning to the reader, about 25% of the factor identifications are marked as uncertain. Identifications were not forced; where evidence for an interpretation was not reasonably ade mate no interpretation was made. Since cross-identification frequently depended on a subjective comparison of different tests, it did not seem possible to use a statistical criterion for confidence in the cross-identifications. One could be used for comparison between analyses using a large group of tests in common, but this did not occur sufficiently often to make cross-identification by statistical methods feasible as a general approach. As explained in an earlier section, not only were common items relatively infrequent, but differences in measurement media made it necessary to base many of the identifications purely on psychological insight.

Table 1 summarizes the cases where there is substantial overlap between analyses. A few cases of scattered common variables occur in addition to those mentioned in the table.

Tabl' :
Overlapping Analyses

Overlapping analyses	Amount overlap	No.of common variables	Subjects ²	Nature of common variables
Abl,Ab2	all	17	different	MMPI scales and PMA tests
WL1,WI2	all	12	different	MMPI scales .
Abl,Ab2,Co,CW				
WL1,WL2	some	11	different	MMPI scales
Ty, Abl, etc.	some	9	different	MMPI scales
CD, Co, CP, FH, Sg, ThA	some	various	different	Strong Interest scales
Co,MD	some	4	different	Bell Inventory scales
Du, FH	full	6	different	Allport-Vernon scales
FT1,FT2	all	12	different	Terman-Miles scores
CaF,CM	some	20	different	Ergs, sentiments
CaB, CaC	all	36	different	Behavior ratings
CaB, CaC, SaB	some	35	same	Behavior ratings
CaE,SaB	full	80	same	Questionnaire items
Lo, ThB	all	13	same	Guilford's factors
No, Lo, or ThB	full	5	different	Guilford's factors
CE, Ey	all	39	same	Clinical observations
GuB, RTC	all	30	same	Questionnaire items
GuC,RTD	all	23	same	Questionnaire items
WB,WM	all	20 .	different	Clinical observations
WH, Wi	some	44	different	Clinical observations
WB er WM, WH or Wi	full	20	different	Clinical observations

lall indicates that all variables match.

Full indicates that every variable in the smaller analysis matches . variable in the larger.

Some indicates that not all the variables in either analysis are matched.

^{2&}lt;u>Different</u> indicates entirely separate analyses.

Same indicates that both analyses were based on the same or substantially the same raw data.

Tucker has developed a Coefficient of Congruence which evaluates the similarity of 2 factors with common variables in somewhat the same way as a product-moment correlation between the loadings of the common variables, but his coefficient is easier to compute. This report also develops a method for rotating the factors in separate analyses so as to be maximally congruent. For purposes of this survey no re-rotations were made. Tables 2, 3, and 4, give the results of computing the Coefficient of Congruence between factors for the pairs of Analyses CaB-CaC, Abl-Co, and WB-WM, respectively.

Table 2

Coefficients of Congruence between Analyses CaB and CaC

II	Mania and Excit.	Ma-Ex-Dt?	III	Minus Depression	Ma	.420
III	Paranoid Schiz.	Ps	IA	Paranoid Schiz.	Ps	.774
IA	Depressed, Deteriorated	Dt i	II .	SchizExcit.	Dt-Et.7	.508

With regard to Tables 2, 3, and 4, 2 points bear discussion:

- l. At least partly because of the very high loadings in Analyses Abl and Co as compared to loadings in CaB and CaC, the Coefficients of Congruence for Abl and Co are very high compared with those in CaB and CaC. This brings about a situation where the writer has accepted identifications with coefficients as low as .427, while he cannot fully accept one of .765 (primarily because of a loading of only .19 on Abl-9 for Factor III). General size of loadings in a positive direction has an influence on the coefficient that goes beyond a reflection of the rank order of the variables defining the factors.
- 2. The computations of the Coefficient of Congruence that are reported here led to one change in the writer's identifications: Factor II in Analysis WM was changed from Dt to Dt-Ex?. This change was suggested by the relatively high coefficient of .850 relating this factor to Factor II of Analysis WB. This change is also in the direction of agreement with the interpretation made by the author of the analysis. This instance reveals that, in making these particular factor interpretations, the writer gave more weight to the 3 or 4 variables with the highest loadings and less weight to variables with moderate loadings than did either the formula for congruence or the author of the analyses.

Composite Factors

The section of Psychometric Monograph, No. 5 concerned with the "parsimonious hypothesis of factorial structure" also discusses and illustrates composite factors. In that survey, however, the matter was dropped simply with that warning. Where composite factors seemed to contain a preponderance of one, the identification of the preponderant factor was made; a question-mark would signify the factor's impurity. Where the composite factor seemed to combine nearly equal amounts of 2 factors (where its vector nearly bisected the angle between the vectors of 2 factors), the factor was left unidentified. In this

survey the same procedure is followed: where there is a preponderance of one factor, identification is made with a question-mark and is sometimes explained in a footnote at the bottom of the table of loadings. Where two or more factors seem to be combined with nearly equal weights, the identification is not made, but the combination is indicated in a footnote, and the list of analyses with each factor in Part II includes these combination factors. A note written for publication in the Psychological Bulletin by Wayne Zimmerman and a rejoinder by the writer explain the dangers to interpretation caused by these combination factors and their proper treatment in a survey of this kind.

PART I

ANALYSES

Part I presents the pertinent information for the interpretation of each of the factor analyses covered by this survey. The analyses are presented in alphabetical order by a code designation which corresponds wherever possible to the first two letters in the author's name. Where the report is written by more than one author, the code is ordinarily the initials of the first 2 authors. In the cases of Analyses Ab, Ft, St, and WL, the same battery of tests is given twice, and separate analyses are reported in the same article. To distinguish the tests as used in each of the two analyses, the number 1 or 2 follows the code letters. The code designation appears at the top of every page of Part I. An index of authors' names (Index II) is included at the back of the book. The Table of Contents for Part I will serve as a list of the analyses and a key to the code letters used. For each analysis the following information is given:

- 1. The full reference to the article describing the analysis and the full reference to the source of data used in the analysis if this data was borrowed. Since these references are given with the analyses, it was considered unnecessary to present a separate bibliography. It is not within the scope of this survey to review the many hundreds of articles on factor theory or to review the articles which contain factor studies not included in this survey for the reasons described in the Introduction.
 - 2. The number and description of the subjects.
 - 3. A note on any peculiarities or unusual techniques used in the analysis.
- 4. A description of each of the variables used in the analysis. Where the same variables are used in more than one analysis, appropriate reference is made for finding their description. Sometimes they require naming only or a description so short that a description other than that provided by the table of loadings is not necessary. In various parts of the survey the length of mention of the variables had to be made to fit space requirements. That is, the description in the beginning of the analysis is the complete one; those in Part II are briefer; those in the index are still briefer and altered to fit alphabetical requirements; and those in the table of loadings are usually briefest of all.
- 5. Factor names. The factor names or short interpretive descriptions given by the authors of the analyses are given at the top of the loadings tables. These are given whether or not they were considered tentative or definite by the authors. Two lines of symbols at the top of the table designate the factors. The upper line, labeled "Identifications," gives the code letters of the factors as identified in at least 2 analyses by the present writer. The key to the code letters is provided by the Table of Contents for Part II. A question mark with the code letters indicates an uncertain identification. A question mark by itself indicates that no identification was reasonably possible. Other situations are explained in footnotes. The second line of symbols are those used by the author of the analysis; these correspond with the ones used with the author's factor names.

ANALYSES

- 6. The table of factor loadings. The heading for this table tells whether rotation was orthogonal or oblique. For ease of reference, only "significant" loadings appear in the tables. Significance for this purpose has been arbitrarily defined as .25 or over. Communalities and reliabilities computed on the same group of subjects are reported in the same table when these are available. For simplicity all decimal points have been omitted. The table also contains the symbol denoting the medium of measurement (see the Introduction) and a very brief name or note to indicate the variable.
- 7. <u>Intercorrelations of the factors</u>. For analyses using oblique rotation, a table of the intercorrelations of the factors is included when the author of the analysis has provided these data.
- 8. Supplementary Analysis List. At the end of Part I there appear the references to analyses whose omission from full treatment in the survey is not entirely based on the principles of selection laid down in the Introduction. A brief explanation for their omission is made.

ANALYSIS Ab

Abrams, E. N. A comparative factor analytic study of normal and neurotic veterans. 1949. Thesis, Univ. of Michigan. Univ. Microfilm, Ann Arbor, Mich.

The subjects were 201 veterans, who were seeking and receiving treatment at the V. A. installations, and 117 normals. In the neurotic group, the veterans were between the ages of 20 and 30, male, white, and were elementary school graduates; they had pensionable disabilities. The 117 normals were veterans and comparable in all respects, except for psychiatric diagnosis. Separate analyses were made for the normal and neurotic groups.

Variables 1-6 are the Primary Mental Ability scores of Thurstone, named in the table of loadings. Variables 7-17 are scores of the MMPI (see Analysis Co).

ANALYSIS BaB

Baehr, M. E. A factorial study of temperament. Psychometrika, 1952, 17, 107-126.

This is an experiment using questionnaire inventory items which would cover the concepts embodied in the factors described in the "second-order analysis" of the Guilford-Martin data, Analysis BaA, and, in addition, the concepts embodied in the general Emotionality factor in the conceptual scheme of Heymans and Wiersma. The 22 behavior-rating items were combined in all possible pairs and presented randomly in a single schedule. For each pair the rater was asked to underline that item which, in general, was more descriptive of the behavior of the person he was rating. The rater was urged to make a choice, but was permitted to mark both words or to mark neither word. For each person, the score for each item was the number of times it was underlined in the schedule. Completed schedules were obtained for a sample of 200 subjects. Communalities were stabilized after two successive factorings by the centroid method.

ANALYSIS BC

Barnes, C. A. A statistical study of the Freudian theory of levels of psychosexual development. Genet. Psychol. Monog. 1952, 45, 105-175.

The subjects were 266 male students, principally Liberal Arts majors, selected from 11 classes of General Studies at the University of Southern California. They ranged from 17 to 31 years in age, with a median age of 23. Testing was done in groups of 40 to 70. Tetrachoric correlations were used.

Each variable consisted of the score on 5-10 yes-?-no items mixed into a questionnaire having 255 items in all. The variables with some sample items were as follows (the direction of the variables is not clear in all cases):

- BC- 1. Pessimism.
- BC-2. Cleanliness. a. You like to wash your hands before every meal. b. A little dirt never hurt anyone.
- BC- 3. Exhibitionism. a. You pay little attention to styles in clothing. b. You would like to have a new model car every year.
- BC- 4. Covert Aggression.
- BC- 5. <u>Impatience</u>. a. It is boresome to wait for a slow person to finish what he is saying or doing.
- BC- 6. Self-confidence. a. You feel your abilities are adequate. b. You can hold your own with others socially.
- BC- 7. Overt Aggression. a. You admire go-getters. b. Attack is probably the best defense.
- BC-8. Sadism. a. Most husbands and wives would be happier if they resorted to caveman tactics occasionally.
- BC- 9. Dependency. a. You would like to live with your parents as long as possible.
- BC-10. Obstinacy. a. It is hard to admit defeat. b. Even when you are wrong, it is hard to admit it.
- BC-ll. Sex predation. a. Men are superior to women in most ways. b. Girls' education should consist mainly of things that are useful around the house.
- BC-12. Punctuality. a. It is easy to excuse tardiness. b. You almost always rise at the same time in the morning and retire at the same hour at night.
- BC-13. Biting. a. You have been free from a habit of nail-biting.
- BC-14. Meticulousness. a. It is a waste of time to try to keep everything in its place all the time. b. "A place for everything and everything in its place" describes one of your habits very well.
- BC-15. Curiosity.

- BC-16. Money. a. All you desire from life is a moderate income. b. Money is one of the least important things in life.
- BC-17. Defiant resentment. a. You often violate school regulations.
- BC-18. Reliability. a. When you borrow something, you feel somewhat uneasy until it is returned.
- BC-19. <u>Law abidance</u>. a. Cheating is permissable sometimes if it means avoiding failure in an important course. b. Sometimes cheating in an examination is all right when the instructor has been unfair.
- BC-20. Overt aggression. a. If a person does not meet an obligation to you, you speak to him about it.
- BC-21. Sex drive. a. You are probably more interested in the opposite sex than most. b. You have been troubled by doubts about your sexual adequacy.
- BC-22. Anti-feminine feelings. a. A woman's place is in the home.
- BC-23. Orderliness. a. There is little point in having things done just so. b. When you write a report, you reread it many times to make sure it is free of errors.
- BC-24. Rigidity. a. Often when trying to think of a person's name, you find another name intruding.

ANALYSIS Be

Bennett, E. Some tests for the discrimination of neurotic from normal subjects. Brit. J. Med. Psychol., 1945, 20, 271.

The subjects were 80 patients in a neurosis center and 80 ordinary patients from surgical and medical wards with no record of psychiatric or neurological disorder. It will be noted that any temporary neurotic tendencies due to hospitalization are thus controlled. Nearly all the subjects were soldiers, but few had suffered the stress of active service.

The battery was highly discriminating between the neurotics ("introverted" types requiring hospitalization and discharges) and normal hospital patients, but separate factor analyses indicated loadings (presented in the article) so similar that the groups were combined for a third analysis, the results of which are presented below.

Summation analysis was used with orthogonal rotation.

The Neurotic Inventory (Variables 1-3): Three sections of this were used, comprising clinical questions bearing upon anxiety, hysteria and depression, which are the most frequent syndromes in the neurotics. The numbers of positive and negative responses intended to indicate neurosis are roughly equal. The total of neurotic responses is scored in each section.

- Be- 1. Anxiety. Sample: Are you often startled at a sudden noise? 8 items.
- Be- 2. Hysteria. Sample: Have you ever walked in your sleep? 7 items.
- Be- 3. Depression. Sample: Do you ever get down in the dumps for no reason at all. 8 items.

The Annoyances Test (Variables 4-7): This test lists 60 possibly annoying stimuli or situations of 4 kinds, 15 of each in random order. The subject is asked to indicate anything which irritates or annoys him. Numbers of annoyances recorded are scored in each section. The 4 kinds consist of two pairs: one member of each pair is intended to indicate neurosis, the other as a control. The 4 kinds are:

- Be- 4. Annoyance due to frustration of self-assertion, for example: "Somebody pushes in front of you in a queue," and "Somebody tells you how to do your job." Responses in this section are expected to be normal, since the feeling is aroused by and directed against another person.
- Be- 5. Annoyance due to personal inadequacy, for example: "You can't remember a name which is on the tip of your tongue," and "You forget what you are looking for." Responses here are expected to indicate neurosis, since the feeling is aroused by, and directed against, the self.

- Be-6. Annoyance due to dirt or untidiness, for example: "A child with a dirty face," and "An unmade bed." Responses here are expected to be normal, since things seen do not demand attention and avoidance is relatively easy, unless there is a positive interest in the environment.
- Be-7. Annoyance due to noise, for example: "A pneumatic drill," and "The sound of hammering." Responses here are expected to indicate neurosis, since the obtrusiveness of noise forces attention outwards and frustrates introverted trends.

The Pressey X-0 Test (Variables 8-10): Three sections of this test were used, substantially modified in accordance with the hypothesis. One hundred items are listed in each section; the total number of items crossed out is scored in each.

Be- 8. Items crossed out are those for which the subject thinks a person should be blamed. Those listed comprise questionable extraverted activities with an aggressive flavour, such as flirting, speeding, and bawling. It was expected that the neurotic, who tends to be innocent of such activities, would be more ready to express his moral feelings against them.

Samples: 1. gambling 2. panic flirting anger speeding distrust drinking scandal giggling contempt

Be-9. Items to be crossed out are those about which the subject has at any time in his life felt worried, nervous, or anxious. Those listed are of a purely personal kind, such as loneliness, sweating, and falling. It was thought that the neurotic might have suffered and would certainly have attended to such experiences more intensely and that his facility for recalling them would be greater.

Samples:

1. loneliness
2. cruelty
work
headache
forgetfulness
teasing
teasing
rudeness
browning-off
depression

Be-10. Items to be cross a out are those which the subject likes or in which he is interested. Those listed are of an extraverted kind, football, comedians, talking, and the like. This section is intended as a measure of the range of objective interest, which should be diminished in the neurotic.

Samples:

1. swimming 2. camping boating walking beaches boxing dirt-tracks running

·.usic-halls

amusement-parks

ANALYSIS Bo

Bolanovich, D. J. Statistical analysis of an industrial rating chart. J. appl. Psychol., 1946, 30, 23-31.

A 14-item rating scale used by the Radio Corporation of America for field engineering was used by 11 supervisors for 143 field engineers. Orthogonal rotation.

The items consisted of a trait name with an explanation of the trait. The rating was to be made in one of five numbered boxes. An attempt to curb bias was made by changing the order of the numbered boxes from item to item. The key to the scales read:

5 = Excellent (among the best 10%)

4 = Superior (among the best 1/3, but not in the best 10%)

3 = Good (in the middle 1/3)

2 = Fair (in the lower 1/3, but not in the lowest 10%)

1 = Poor (among low 10%)

Examples of the fully presented items are:

Bo-1. Personality: Cheerfulness and pleasantness in relations with others. Extent of friendships with associates and customers. Ability to hold confidence and admiration.

1 2 3 4 5

Bo-6. Resourcefulness: Success in handling routine and special problems without continual help.
Activity in developing new applications, finding new needs for equipment. Suggestions for equipment, methods, procedures, and making new products.

ANALYSIS BrA

Brogden, H. E. A factor analysis of forty character tests. <u>Psychol.</u> Monog., 1940, 52, No. 3, 39-55.

The subjects were sixth-grade boys in 11 public school classes. Obtaining complete data required reducing the number of cases actually used to 100 for most variables with slightly fewer cases on some variables. In reducing the number of cases there was selection in the direction of greater intelligence and higher scores on the character tests.

- BrA-1. Maller Self-Marking Test. This is a simple achievement test covering such topics as geography, history, and arithmetic. However, mixed with questions of a sixth-grade caliber are many far above this level. A key was enclosed and the grading done by the student himself, in order that he might have ample opportunity to cheat. His score is the number of correct answers given by the subject to those questions known to be beyond his ability.
- BrA-2. Coordination Test. This test of Hartshorne and May measures the tendency of the child to "peep" in order to obtain a good score on a task which should be done with the eyes closed.
- BrA- 3. False Book List. This test of Raubenheimer consists of a list of book titles which are to be checked by the child if he wishes to indicate that he has read them. Since many of the titles are fictitious, an overstatement score can be obtained by determining the number of fictitious titles the child claims to have read.
- BrA-4. Overstatement Test. The child is asked to state the degree of his knowledge of a number of topics and is then given a test designed to determine the validity of his claims. The score is the difference between the claims of the child and his achievement score.
- BrA- 5. Suggestibility Score. Four test scores are combined since their intercorrelations are low (!). The first 2 are forms A and B of the Otis suggestibility test which include a variety of item types. In the third, the child is shown many pairs of words, some of which pairs, actually determined by chance, are stated to be extensively used as synonyms. The child is asked to indicate those pairs made up of words which he would most often use as synonyms. Presumably the suggestible child would choose the pair stated to be used most extensively. In the fourth test, it is suggested that ink blots resemble objects or animals which they may or may not resemble. Here again the child may accept the suggestion by indicating that he sees the supposed similarity. High score indicates non-suggestibility.
- BrA-6. Persistence Adding. Thirty groups of two-number additions were administered in consecutive periods of 45 seconds each. Since adding speed decreases in the later periods, a measure of persistence was determined from this decrease. High score made to indicate persistence.

BrA

- BrA- 7. Persistence Stories. The test measures the child's persistence in completing a story which becomes increasingly difficult to read after the point of suspense has been reached. The material is run together, the capitals and small letters are misplaced, and the words are improperly spaced.
- BrA- 8. Picture Inhibition Test. The score on this test of Hartshorne and May is the difference between the average number of additions completed each period under normal conditions and the average of those finished each period with distractions such as jokes, puzzles, and stories printed directly above the additions. (Scores reversed).
- BrA- 9. Picture Inhibition Persistence. A persistence score was derived from the Picture Inhibition Test, by taking the difference between the average of the first two and the average of the last two groups of additions. (Scores reversed).
- BrA-10. Slang "A" Score. The score was that yielded by Schwesinger's tests of knowledge of slang words and slang expressions.
- BrA-11. Slang "C" Score. In answering the questions in the multiple choice division of the slang knowledge test, the subjects could usually make two correct choices, one of which was a slang expression. The "C" score is simply the number of times the subject used a slang expression in making a correct choice.
- BrA-12. Variability Score. The standard deviation of the thirty addition scores obtained from BrA-6.
- BrA-13. Questionable Reading Preferences. This test, devised by Raubenheimer, consists of a list of 10 book titles, which the child ranks in the order of his preference. It is designed to select children who show interest in reading matter which is judged to be unwholesome.
- BrA-14. Questionable Character Preferences. 14-19 are from Form B-1 of the Opinion Ballots of Hartshorne and May. This one contains a list of character descriptions of widely differing "goodness." After the child ranks them in the order of his preference, his score is obtained by adding the differences between his ranking and that of competent judges.
- BrA-15. Questionnaire on Authority. By encircling either all, most, many, few or no before a list of statements, the child expresses his opinion about various aspects of authority.
- BrA-16. Questionnaire on Success and Helpfulness. One questionnaire on the connection between success and such items as pull, trickery, a clear conscience or going to church combined with another questionnaire giving a variety of situations where subject says whether or not he would be willing to help other individuals.
- BrA-17. Questionnaire on Honesty. The child is asked if he would cheat in a variety of situations and is scored by the number of affirmative responses.

BrA

- BrA-18. Questionnaire on Duty. In this test, a series of choices are presented to the subjects. The choices usually involve an opposition between duty and pleasure, or between negligence of duty and pain or discomfort.
- BrA-19. Stories Test. This test by Chambers consists of a series of stories attempting to present life-like situations involving ethical choices.
- BrA-20. Controlled Association. This test was designed by Raubenheimer to determine the habitual reactions of subjects to social and educational institutions. The subject has to make his choice of the most suitable of several statements concerning a number of such institutions.
- BrA-21. S Perseveration Test. To obtain the score on this test the speed of writing S's forward, writing them backward, and alternating forward and backward must be determined. The number completed during the alternation period is then divided by the average of the scores for the other two periods. (Scores reversed).
- BrA-22. V Perseveration Test. This test is the same as test 21 except for the use of a different letter.
- BrA-23. Add-Subtract Perseveration Test. This test consists merely of a series of two-number additions and subtractions. The letters A and S over each problem indicate whether the subject should add or subtract.
- BrA-24. Test of Conscientiousness. While the Pressey X-O test was administered, it developed during the scoring that a large percentage had failed to complete all the procedures called for by the directions. Consequently, it was included in the battery not as a test of emotional maturity but as a measure of faithfulness in the carrying out of directions.
- BrA-25. Deportment Grade. Average of monthly deportment grade for the first semester.
- BrA-26. Grades. Average grade for the first semester.
- BrA-27. Personality I. A measure of social adjustment derived from Woodworth's inventory. Weights used in determining this score were the result of a previous unpublished factor analysis made by the writer.
- BrA-28. Personality II. This, a second factor found in the Woodworth inventory, seems to be a measure of self-sufficiency.
- BrA-29. Variability II. This score was obtained from the Otis Intelligence Test by calculating the standard deviation of the 10 standard scores of the sub-tests.

Variables 30-39 are the subtests of the Otis Intelligence Test. The names are given in the table of loadings.

ANALYSIS BrB

Brogden, H. E. A multiple-factor analysis of the character trait inter-correlations published by Sister Mary McDonough. <u>J. educ. Psychol.</u>, 1944, 35, 397-410.

The intercorrelation data used for this study were those of McDonough, Sister Mary. The Empirical Study of Character. The Catholio Univ. of Amer., Washington, D. C., 1929, pp. 193. The subjects were students in a parochial school, 20 boys and 30 girls aged 13 ± 1.25. Ratings were made on 34 characteristics by three teachers, all of whom had frequent contact with the children. If the ratings of one judge were found to correlate less than .6 with those of the other two judges, ratings for that judge on that item were discarded, and if the intercorrelations of all judges fell below .6, that item was discarded. To increase the reliability of the data, behaviorly defined subtraits were assembled, rated, and intercorrelated to eliminate traits that were overcomplex. Multiple-factor analysis by the centroid method was employed with extraction of 5 factors; the fifth one was later discarded as contributing nothing to simple structure. Oblique rotation.

The traits used for ratings are listed in the table of loadings. A few whose descriptions go beyond the trait names are as follows:

- BrB-1. <u>Will</u>. Persistence in school work, attentiveness in spite of distractions and the keeping of resolutions.
- BrB- 4. Reliability. Preparation of homework, keeping of promises, honest scoring of papers, diligence without supervision.
- BrB- 5. Attitude toward work. Diligence in school work.
- BrB- 9. Respectfulness. Politeness and courtesy.
- BrB-10. Generosity. Tendency to think of others, not to expect others to wait on him to offer help, forgive those who hurt him, to be unselfish.
- BrB-27. Expressiveness. Tendency to be easily moved to anger or grief, to recover composure quickly, to get excited over trifles, to become confused easily, not to be stiff or sedate, to give vent to feelings without restraint, to be spontaneous, not to be quiet or calm, and not to be certain of one's self.
- BrB-34. Forwardness. Timidity, modesty, tendency to be retiring, and lack of desire to recite or run errands.

ANALYSIS BT

Brogden, H. E., and Thomas, W. F. The primary traits in personality items purporting to measure sociability. <u>J. Psychol.</u>, 1943, <u>16</u>, 85-97.

The subjects were 365 students who had availed themselves of the testing service offered by the Psychology Department of the University of Illinois.

The responses to the items could be "Yes," "?," or "No." All "?" responses were combined with the least frequent of the other two categories so that tetrachoric correlations could be used. Analysis was done by the centroid method with oblique rotations.

No key to the test is given in the article. The response making psychological sense is printed in italics here. The key for most but not all of the items can be derived from the tables in the article which describe the individual factors.

- BT- 1. Do you day-dream frequently? Yes No ?
- BT-2. Do athletics interest you more than intellectual affairs? Yes No
- BT- 3. Are you slow in making decisions? Yes No ?
- BT-4. Do you think you could become so absorbed in creative work that you would not notice a lack of intimate friends? Yes No?
- BT- 5. Are you inclined to study the motives of other people carefully? Yes No ?
- BT- 6. Do you ever heckle or question a public speaker? Yes No ?
- BT- 7. Do you prefer traveling with someone who will make all the necessary arrangements to the adventure of traveling alone? Yes No?
- BT-8. Would you dislike any work which might take you into isolation for a few years, such as forest ranging, etc.? Yes No?
- BT- 9. Have books been more entertaining to you than companions? Yes No ?
- BT-10. Do you want someone to be with you when you receive bad news? Yes No?
- BT-11. Do you usually prefer to do your own planning alone rather than with others? Yes No?
- BT-12. Do you often feel lonesome when you are with other people? Yes
- BT-13. Do you usually enjoy spending an evening alone? Yes No ?

- BT-14. Do you often find that you cannot make up your mind until the time for action has passed? Yes No?
- BT-15. Do you especially like to have attention from acquaintances when you are ill? Yes No ?
- BT-16. When you are in low spirits do you try to find someone to cheer you up? Yes No?
- BT-17. Does your ambition need occasional stimulation through contact with successful people? Yes No?
- BT-18. Do you find that people are more stimulating to you than anything else? Yes \underline{No} ?
- BT-19. Do you tend to be radical in your political, religious, or social beliefs? Yes No?
- BT-20. Do you prefer to be alone at times of emotional stress? Yes No ?
- BT-21. Do you usually prefer to work with others? Yes No ?
- BT-22. Do you get as many ideas at the time of reading a book as you do from a discussion of it afterward? Yes No?
- BT-23. Do you prefer making hurried decisions alone? Yes No ?
- BT-24. Are you considered to be critical of other people? Yes No ?
- BT-25. Do you like to be with people a great deal? Yes No ?

LOADINGS ON OBLIQUE FACTORS

- I. Intellectual Independence. Some resemblance to Mosier's "Autistic Tendency"; see items 1 and 12.
- II. Gregariousness. Not related to Guilford's S. Does not imply social skill. Resembles Layman's second factor.
- III. Liking for prolonged speculative consideration of problems or social inhibition. Resembles Guilford's GD.
- IV. Need for the sympathy and affection of family or close friends.
- V. Intellectual Leadership. Resembles Guilford's factor having this name.

ANALYSIS CaA

Cattell, R. B. The description of personality: principles and findings in a factor analysis. Amer. J. Psychol., 1945, 58, 69-90.

The subjects were 208 adult men, soldiers in ASTP programs, business and professional groups, mean age 30.2 years. Ratings were made by different judges for each group of 16 men, 2 judges for each group. Correlations were averaged for the 13 different groups via the Z-function.

Judges were use: to select 171 representative trait names from a much larger list of personality characteristics found in the dictionary. To boil down the number of variables further 100 adult subjects were rated dichotomously on the 171 traits. For the factor analysis the 35 traits were selected that represented nuclei of other clusters or were confirmed by other researches as clusters.

The title of each cluster is sometimes distinctly wider in reference than the three actual traits listed would seem to justify (notably in clusters 5, 14, 15, 21, 33); there are usually at least six traits in the cluster. The aim has been to represent as accurately as possible, by the title and traits in combination, the general character of the cluster. Occasionally, where the three highest traits would give a misleading impression in this respect, slightly lower but less overlapping traits on the cluster correlation list are given.

CaA- 1.	Self Assertive Boastful Assertive Conceited	VS	Self Submissive Modest Submissive Self critical, dissatisfied

ANALYSIS CaB

Cattell, R. B. Confirmation and clarification of primary personality factors. Psychometrika, 1947, 12, 197-220.

This study was one of three devoted to confirming factors previously found in behavior rating data, questionnaire data, and objective test data and to determining the relationships among the factors in these three fields, to test the hypothesis that they are actually the <u>same</u> factors outcropping in different media. This analysis concerns behavior rating data only. The subjects were 133 men among 373 university students (including veterans). Analysis CaC uses the same items, but women subjects. Thirteen factors were extracted of which 2 were found to be residual factors after rotation. Oblique rotation was used without knowledge of the variable names.

The behavior ratings were carried out by groups of 17 who knew each other well and who rated each other. They rated all ratees at one time with respect to a given trait. The instructions were to divide the group in the proportions of approximately 2, 1, and 1 for average, high and low on the trait, respectively. The highest subject and the lowest subject were also noted. This produced a 5-point scale distributed approximately normally.

Included in the study were 2 variables that were previously found to have high loadings on each factor in a previous study plus at least one other variable intended to measure each factor as purely as possible. The "definitions" upon which the ratings were based consisted of a trait name, sometimes with one or two parallel names, and a description up to 50 words in length representing both ends of the trait continuum being defined. Below are the trait names for the two ends of each continuum with the full definitions included for the first two variables only.

VS

CaB-	l.	Readiness to cooperate
		Generally tends to say yes
		when invited to cooperate.
		Outgoing. Ready to meet
		people at least halfway.
		Finds ways of cooperating
		despite difficulties.

vs	Obstructiveness
	Inclined to raise objections
	to a project, cynical or real-
	istic. "Cannot be done." Un-
	interested or unfavorable atti-
	tude to joining in. Inclined
	to be "difficult."

CaB- 2.	Emotionally Stable
	Can be depended upon to
	look at questions objec-
	tively, without emotional
	prejudice, and in the same
	constant light from day to
	day. Above emotion in his
	judgments. Dependable and
	realistic.

Changeable
Sees things in terms of the
emotion of the moment. Emo-
tional bias changes from day
to day and place to place.
Does not remain the same per-
son from day to day. Unde-
pendable.

	realistic.		
CaB- 3	. Attention-getting	vs	Self-sufficient
CaB- 4	. Assertive, Self-assured	vs	Submissive
CaB- 5	. Depressed, Solemn	vs	Cheerful
CaB- 6	. Frivolous	vs	Responsible

CaB

		•
CaB- 7. Attentive to People	vs	Cool, Aloof
CaB- 8. Easily Upset	vs	Unshakable Poise, Tough
CaB- 9. Languid, Slow	vs	Energetic, Alert
CaB-10. Boorish	vs	Intellectual, Cultured
CaB-ll. Suspicious	vs	Trustful
CaB-12. Good-natured, Easygoing	vs	Spiteful, Grasping, Critical
CaB-13. Calm, Phlegmatic	vs	Emotional
CaB-14. Hypochondriacal	vs	Not so
CaB-15. Mild, Self-effacing	vs	Self-willed, Egotistic
CaB-16. Silent, Introspective	Vs	Talkative
CaB-17. Persevering, Determined	Vs	Quitting, Fickle
CaB-18. Cautious, Retiring, Timid	vs	Adventurous, Bold
CaB-19. Hard, Stern	vs	Kindly, Soft-hearted
CaB-20. Insistently Orderly	vs	Relaxed, Indolent
CaB-21. Polished	vs	Clumsy, Awkward
CaB-22. Prone to Jealousy	vs	Not Prone to Jealousy
CaB-23. Rigid	vs	Adaptable
CaB-24. Demanding, Impatient	vs	Emotionally Mature
CaB-25. Unconventional, Eccentric	v 's	Conventional
Cab-26. Placid	vs.	Worrying, Anxious
CaB-27. Conscientious	vs	Somewhat Unscrupulous
CaB-28. Composed	Vs	Shy, Bashful
CaB-29. Sensitively Imaginative	vs	Practical, Logical
CaB-30. Neurotic Fatigue	vs	Absence of Neurotic Fatigue
CaB-31. Esthetically Fastidious	vs	Lacking Artistic Feeling
CaB-32. Marked Interest in Opposite Sex	vs	Slight Interest in Opposite
CaB-33. Frank, Expressive	vs	Secretive, Reserved

CaB

CaB-34. Gregarious, Sociable	vs	Self-contained
CaB-35. Dependent, Immature	vs	Independent-minded
CaB-36. In.elligence	vs	Deficiency of Intelligence

This was the A.C E. Psychological Examination.

ANALYSIS CaC

Cattell, R. B. The primary personality factors in women compared with those in men. Brit. J. Psychol. Stat. Sec., 1947, 1, 114-130.

The subjects were 240 undergraduate women at the University of Illinois, living in sororities and independent houses averaging about 20.7 years of age. Since this was the same experiment as Analysis CaB except that the data for the men were used there and the data for the women are used here, both details concerning the collection of data and the description of the variables may be found under Analysis CaB.

Analysis CaD

Cattell, R. B. Primary personality factors in the realm of objective tests. J. Personality, 1948, 16, 459-487.

The tests were given to 130 men and 240 women college students, who were paid to attend the testing, but who were also motivated by interest in their own personality testing results. About one third of the tests were individual tests carried out in 3 l 1/2-hour sessions per person; the group testing was done in 5 sessions ? 2 hours each. All test scores were rescaled to a 12-point range and intercorrelated by the product-moment r. Most r's are small, presumably because (1) the tests were chosen to represent the whole range of the personality sphere and are thus mostly remote from one another, and (2) the tests, being intended to be exploratory, are uniformly brief and of relatively low reliability. Factorization was by Thurstone's grouping method for 10 factors, the last 2 by the centroid method.

The construction of the test variables was intended to: (1) create objective tests directed to the essence of the factors previously found in studies of behavior ratings as indicated by their psychological meaning and by clinical-type observations of the individuals outstandingly high or low in factor endowment. (2) To establish contact with all sufficiently confirmed factors previously found in the field of objective personality tests. (3) As in the previous rating studies the necessity remained to represent the <u>personality sphere</u> as evenly as possible, although here our attempt to do so must be relatively blind. (4) To use brief tests. The tests were given in the order shown by the numbers in parentheses.

Tests used as landmarks of previously discovered factors:

- CaD- 1. (11) Intelligence (Factor I). ACE Psychological Examination, College level.
- CaD- 2. (2) Perseveration or Disposition Rigidity (Factor XXXII). 12 minutes of "creative effort" type tests; 5 motor and 2 perseptual tests.
- CaD- 3. (1) Fluency of Association (Factor XXVII). I combination of the fluency factors found by other investigators is here measured by 10 subtests, 8 of them old tests (ink-blots, pictures, drawings, various story-completion and verbal tests) and 2 new exploratory tests. Total time: 19 minutes.
- CaD- 4. (4) Slowness of Reaction Time (Factor XXIVa). This was measured by 40 auditory and 40 visual reaction times, half with regular, half with irregular interval after the warning signal. The score is the average of 80.
- CeD- 5. (3) Speed of Judgment (Factor XXIa). The subject was presented with 40 statements consisting of generalizations about personality and social behavior and was asked to mark them essentially true or incorrect. The score is the number of items marked in 4 minutes.

- CaD- 6. (6) Mechanical, Ideomotor, or Psychomotor Speed (Factor XXIa). 5 minutes on speed of writing and reading and 4 on speed of cancellation of letters and numbers.
- CaD- 7. (7) Perceptual Speed (Factor XXIb). Thurstone's perceptual closure factor represented by incomplete words (1 1/2 min.) and incomplete drawings (1 1/2 min.).
- CaD-8. (10) Time of Dark Adaptation (Factor XXIb). Since Thurstone's perceptual closure factor had a loading on dark adaptation time, this variable was included. Standard glare was followed by measurement of the time to perceive faintly illuminated letters.
- CaD- 9. (13) Oscillation (Factor XXa). This was measured by differences in consecutive 7-second periods of performance (cumulatively added) for adding, coding and letter canceling, 63 seconds of each.
- CaD-10. (31) Fluctuation of Attitudes (Cluster XXa). The subject checked 50 attitudes on personal and social matters on the first day of testing and rechecked them 6 weeks later. The score was on changes, regardless of direction.
- CaD-11. (12) Honesty-Integrity (Factor XII) 1. Overstatement. This was the usual statement of books read, checked later against questions involving recognition of the chief characters or subject matter. Equal weight was given to a second section in which nonexistent books could be checked as read. 5 1/2 minutes of testing and 5 of retesting.
- CaD-12. (20) Honesty-Integrity (Factor XII) 2. Cheating. The usual dotting test with closed eyes, scored for items that could not be attained without vision. Given as a "co-ordination test." Two runs of 10 seconds each.
- CaD-13. (16) Honesty-Integrity (Factor XII) 3. Cursive Miniature Situation Test. A C.M.S. test is one where behavior is observed in an experimental situation made to resemble situations in real life; the experimental situation is made to move and change, requiring adaptations from the subject to an unfolding situation. This one involved crossing various types of lines under certain conditions. In this case the situations were changed by having the subject turn pages on a signal. The score was the number of "slanting lines crossed," which represented a way in which the subject could increase his score illegally.
- CaD-14. (35) Active-Reliable Will (Factor XIII) vs. Suggestibility to Authority.

 The test presented 24 opinions on which the subject indicated his reaction. Later, authorities were quoted against him and the shift toward enthority was measured. (Compare variable 48.)

- CaD-15. (45) Determined Will, Endurance (Factor XIV). This was the combined score on (1) intensity of electric shock reached before the subject demanded cessation, and (2) time in holding up a leg.
- CaD-16. (28) Dynamic Momentum (Factor XVI). This involved the length of time a person continues with a task not clearly soluble. In this test the subject could spend either much time on a few items or a little on many. Two tests were combined: (1) anagrams: words found per item, (2) mathematical puzzles with several solutions: solutions per puzzle. Time was such that all items could not be attempted.
- CaD-17. (21) Mental Initiative (Factor XVII), Absence of Questionable Preferences in Reading. This is a reading preference test designed in terms of book titles that would appeal to a mature personality versus those of a sensational type. Scored for good, "unquestionable," preferences.
- CaD-18. (9) Tempo (The "Verbal Speed" of Allport and Vernon)(Cluster XXIc).

 The score here is a combination of two tests: the speed of sorting cards with no instructions to hurry and the natural speed of talking.
- CaD-19. (8) Thurstone's Perceptual Factor D (Factor XXb), Alternating Perspective. Speed of uncontrolled alternations on the Necker Cube in 1 minute. See CT-5.
- CaD-20. (41) Thurstone's Perceptual Factor E (Factor IVc), Two-hand

 Co-ordination. This was the score on the two-hand co-ordination apparatus, made and administered as described by Thurstone (high score represents good perception and control). See CW-12.

Newly invented tests to measure personality factors:

Factor A, Cyclothymia - Schizothymia has no expected loadings in the above, except perhaps in reaction time and attitude fluctuation.

- CaD-21. (14) Number of Jokes Considered Funny. The subject was asked to check a series of jokes as "good" or "poor," keeping fairly close to a 50/50 use of these terms. The score is the ratio good to poor.
- CaD-22. (5) Ratio of Regularly Warned to Irregularly Warned Reaction Time.

 This score was the ratio of reaction time with sign. 1 regularly two seconds before, to time with a signal varying irregularly from a 1- to a 6-second fore-period. 40 reactions, half in an auditory, half in a visual series, were given under each category.
- CaD-23. (39) Color-Form Ratio in Sorting. This was the same as Thurstone's test. The subject is asked to sort cards into labeled boxes without further instruction. The score is the ratio of cards sorted correctly by color to the number sorted correctly by form, where these classifications conflict.

Factor B, General Ability in Personality, is already adequately represented by the intelligence test and probably by Information, Fluency, and others.

Factor C, Emotional Maturity and Stability vs. General Emotionality, is represented in part by variables 2, & (following Eysenck), 13, and perhaps 10. The following variables were added to separate C and G:

- CaD-24. (25) Ratio of Recall of Emotional to Nonemotional Words. A list of short sentences, some abstract and indifferent, others naming emotional situations, was presented for 1.5 minutes, recalled by sentence completion 2 minutes later, and repeated. The index is emotional/nonemotional words recalled.
- CaD-25. (27) Impairment of Mental Performance (Memorizing and Arithmetic Problem) by Unpleasant Emotion. The subject recalled learned material after the interpolation of (a) easy "riddle" problems and (b) emotional disturbance of having to write down aspects of his personality that he felt to be humiliating. The score as the excess of (a) over (b). This score was combined with a second test score in which the impairment of arithmetical performance by emotionally disturbing noise (battle record, amplified) was recorded. The former contributed more to the compounded variance.
- CaD-26. (42) Body-Sway Suggestibility. Forward and backward sway of the blindfold subject was recorded in inches, positive when it agreed with the direction suggested by the experimenter (or amplified phonograph record: "You are falling forward, falling forward, etc....").
- CaD-27. (32) Departure from Fairmindedness. The subject first agreed to certain "facts" in isolation. He was then asked about these facts in contexts of his own attitudes requiring a distortion of these facts. The score was the extent to which he was prepared to distort them for immediate argument.

Factor D, Infantile, Sthenic Emotionality vs. Phlegmatic Frustration Tolerance.

CaD-28. (46) Impairment of Mirror Drawing by Emotion. The subject was timed on drawing a difficult star pattern in a mirror drawing test. After two practice runs on a simple figure the subject made 3 successive runs, on the middle one of which he was threatened with electric shock for poor performance and shocked regardless of his performance. The score was twice the middle time minus time on the first and last.

Factor E, Dominance vs. Submissiveness. Variable 14 should be negative on this factor.

CaD-29. (29) Criticalness. There were 3 pooled sub-tests: (1)
Underlinings of "false," "absurd," or "stupid" in views on
others attitudes. (2) Words, pictures, and characteristics
of town and nation indicated as unsatisfactory when the subject's judgment was invited. (3) Number of criticisms of the
whole test procedure when asked to write comments. (2) and
(3) were corrected for fluency.

- CaD-30. (30) Ratio Self-to-Other Criticism. This was a rescoring of variable 29 data: the ratio of criticisms/approvals of self and ego-involved objects divided by the ratio of criticisms/approvals of things in general.
- CaD-31. (18) Self-Confidence. This was estimated from 2 subtests, somewhat greater weight being given to the first: (1) S's rating of his own performance in a test where objective judgment was nearly impossible, (2) ratio of items judged good to those judged defective in another (memorizing) test.
- Factor F. Surgency vs. Desurgency.
- CaD-32. (33) Myokinesis. The subject was scored on mean length attained in 20 attempts to reproduce, blindfolded and with no wrist contact on the paper, a l-inch line and 20 attempts to reproduce a 2-inch line. The 2 parts correlated .71.
- CaD-33. (17) Aspiration Level. Level was taken with respect to performance on the C.M.S. test (Variable 13). The score was the average of absolute level forecast on the second and third runs of the test.
- Factor G, Integrated Character vs. Dependent Character. The perseverance and conscientiousness of this factor may show itself in the endurance test, tests listed under C factor, and in the honesty-integrity variables (12 and 13).
- CaD-34. (15) C.M.S. Test: Excessive Use of Circles. On the C.M.S. test (variable 13) circling a given number of lines rather than crossing them is permitted. This score represents excessive use of circles.
- CaD-35. (47) Embarrassment in Mirror Drawing Tasks. To cancel out sheer dexterity, the time on an equivalent tracing of a pattern by direct view was subtracted from that on the star in the mirror. The mean of 3 successive pairs of runs was taken.
- CaD-36. (38) Ratio Consonant/Dissonant Statements Recalled. The subject checked a series of opinion statements "agree" or "disagree" and, after an interpolated activity, was asked to recall without previous instruction to memorize. The score is the fraction of "agreed" opinions recalled minus the fraction of "disagreed" views recalled. This was not merely a measure of tendency to disagree, since the correlation of agree-disagree with this was only -.19. The hypothesis was that the more integrated character will recall both sides.
- Factor H, Adventurous Cyclothymia vs. Withdrawn Schizothymia. Assuming this is the <u>constitutional</u> schizoid pattern, it will show some tests with Factor A and have others more specific.
- CaD-37. (43) Magnitude of Mean P.G.R. Deflection. This was the mean percentage drop to 5 verbal stimuli, 5 noxious physical stimuli, and 2 tasks.

- CaD-38. (22) Ratio Purposeful to Chance Observation and Memory. The subject was asked to read a passage and observe 3 or 4 different kinds of facts. He was questioned immediately on these facts and, soon after, on the irrelevant matter, e.g., drawings sketched around the passage. The score is the ratio of purposeful to nonpurposeful observation.
- CaD-39. (24) Improvement during a Complex Task. The subject performed a task of reading and recording that required the maintenance of several mental sets. The score was the performance during the second 2 minutes divided by that during the first 2 minutes. Repeated with a different task.
- CaD-40. (26) Ability to Handle Surprises. This was the score on a series of riddles which demanded intelligence as little as possible but, instead, an unusual way of looking at things and handling the unfamiliar. See CT-7.
- CaD-41. (44) Frequency of P.G.R. Deflections when Stimulated. The subject looked for one minute into a dark box while frequency of spentaneous deflections was recorded. This might be expected to indicate the liveliness of imagination studied in Factor I or, more probably, the dynamic spontaneity of the H factor.
- Factor I, Sensitive Emotionality vs. Rigid Mature Poise. Variables 42 and 43 are to distinguish between sensitive, unstable intuitiveness with nervous "jumpiness" and a practical, explicit, matter-of-fact logicality.
- CaD-42. (36) Ability to State Logical Assumptions. The score was the sum of 2 scores (r=.58) derived from the Watson-Glazer test of fairmindedness and critical thinking. In one, the subject selected the essential assumptions underlying 8 statements and in the other he stated what he considered the assumptions to be (inventive) on 4 statements.
- CaD-43. (40) Proneness to False Reactions in Reaction Time. In the series of 20 auditory and 20 visual reactions with regular warning were interspersed 4 false visual stimuli and 4 false auditory stimuli respectively. The score was the number of false stimuli to which S reacted.
- Factor J, Thoughtful Neurasthenia vs. Vigorous, Simple Character. Variable 43 might belong; the following are mainly of "dynamic vigor." Variable 3 might also be related to this factor
- CaD-44. (23) Immediate Memory Power. Several tests of memorizing occurred indirectly in these experiments. This score is a combination of score on memory for complex issues in 4 passages, deliberately memorized and immediately recalled, and memory for 2 series of short sentences, deliberately memorized and recalled after 1 minute.
- CaD-45. (48) Effort Curve. It has been suggested, on clinical observation, that the neurasthenic's fatigue curve differs from normal in being concave. The subject pulled to a 2-second metronome chafinger ergograph against 3 Kg. until he could pull no more (1-2 min.). The amplitude 2/3 of the way toward total cessation was divided by initial amplitude.

- CaD-46. (37) Ability to Recognize the Possibilities of Order Classification.

 Various kinds of material were presented to the subject, and he was asked to name as many useful categories as possible into which each could be divided for filing purposes, etc. The score was the number of categories suggested, after striking out any farfetched classifications
- Factor K, Trained, Socialized, Cultured Mind vs. Boorishness.
- CaD-47. (19) Total Information. This was a general information test with 23 categories of knowledge, 72 items in all; 25 minutes. This would almost certainly correlate most with intelligence, but we were also hopeful of finding that the part not due to intelligence would be due to K factor of some "energy-interest" factor in personality.
- CaD-48. (34) Immaturity of Opinion. In this test the subject stated his opinions (attitudes) on a wide range of issues and later was asked to state them again in a context of factual statements (3 to each attitude) that would have occurred spontaneously to anyone making a foresighted mature judgment. The shift toward the mature position, measured here, might be an index of immaturity of the original view, of wrongness of the original view, or of willingness to modify. As such it might be expected to load G as well as this factor.

CORRELATIONS WITH OBLIQUE FACTORS

- 1. Like surgency, and cyclothymia, tempo
- 2. Mental initiative, Thurstone's Speed of Closure
- 3. Femininity, low dominance; unforceful, dependent nature
- 4. Psychomotor efficiency, Thurstone's Rate of Alternations
- 5. Fluctuation (inverted); either Emotionally Mature Stable Character vs.

 Demoralized General Emotionality or a behavior-rating schizoid factor,
 rigidity with low energy
- 6. Spearman's "g". General Ability in Personality
- 7. Thurstone's Flexibility of Closure, excitability and lack of composure, perhaps honesty-integrity but lacking overstatement
- 8. Trained, Socialized, Cultured Mind vs. Boorishness (inverted); Active Reliable Will
- 9. Reaction Time, perhaps with alertness
- 10. General Neuroticism (inverted) as suggested by Eysenck's findings
- ll. Residual

ANALYSIS CaE

Cattell, R. B. The main personality factors in questionnaire, self-estimate material. J. soc. Psychol., 1950, 31, 3-38.

The subjects were the same 370 20-year old men and women undergraduates as were subjects at the same time for other studies.

The letters, Roman numerals, and name introducing the items used as variables listed below are the same as those in the "Master Index" obtained from surveying all past questionnaire analyses (Cattell, R. B. The Description and Measurement of Personality. New York, World Book Co., 1946.) They indicate the presumed factor that the question is chosen to represent. QP means a questionnaire with personality items, QA with attitude items, and QI with interest items. Eleven items included to mark Brogden's factors are so indicated. The items were presented o the subjects in scrambled order.

Each question permitted three answers: Yes, Uncertain, or No. In order to facilitate correlation that pole of the reply was considered positive in scoring which received a minority of the actual responses. The answer printed (or underlined) below indicates the pole of the reply which was thus considered positive in scoring for correlation, etc. Tetrachoric correlations and the group centroid method were used.

- CaE-1. QP I. Shyness. Are you a preson relatively free from self-conscious shyness, so that you are not driven to kcop in the background on social occasions? (No)
- CaE-2. QPI. When you come to a new place are you rather painfully slow at making new friendships? (Yes)
- CaE-3. QPI. In conversation does your mind tend to keep to one track and deal thoroughly with one topic at a time so that you find difficulty in jumping from topic to topic as quickly as some people do? (Yes)
- CaE- 4. QP IIa. General Emotional Hypersensitivity. Are you a person whose feelings are rather easily hurt, e.g., by criticism? (Yes)
- CaE- 5. QP IIa. Do you tend to get over-excited and easily rattled in exciting situations? (\underline{Yes})
- CaE-6. QP III. Melancholy Agitation. Are you often just miserable and in low spirits for no sufficient reason? (Yes)
- CaE- 7. QP III. Do you rather often feel worried and tense with very little cause? (Yes)
- CaE- 8. QP IV. General Neurotic Maladjustment. Do you have frequent periods of feeling lonely, even when you are with people? (Yes)
- CaE- 9. QP IV. Do you feel that you are not yet well adjusted to life, that very little works out the way it should? (Yes)
- CaE-10. QP IV. Do you experience powerful moods, so that other people get the impression that you are changeable? (Yes)

- CaE-11. QP V. Schizoid Asthenia. Do you daydream rather a lot? (No)
- CaE-12. QP V. Are you troubled by useless, stray thoughts which run through your mind uncalled for? (Yes)
- CaE-13. QP V. Do you find that your memory is poor and lets you down unexpectedly rather frequently? (Yes)
- CaE-14. QP VIa. Confident Self-Assertion. Do you generally feel entirely self-confident about your ability to make a success of your life? (No)
- CaE-15. QP VIa. Do you unhesitatingly complain to a waiter or the manager if you are served bad food in a restaurant? (Yes)
- CaE-16. QP VIb. Hypomanic Aggressiveness. Do you ever try to argue or bluff your way past a guard or a doorman? (Yes)
- CaE-17. QP VII. Group Deference. Do you find it difficult to get up and address (or recite before) a large group? (No)
- CaE-18. QP VIIIa. Self-sufficiency (v. Gregariousness). Can you become so absorbed in creative work or some interesting job that you do not mind a lack of intimate friends? (Yes)
- CaE-19. QP VIIIa. Do you enjoy being in large gatherings, as at parties or dances? (No)
- CaE-20. QP VIIIa. When travelling would you rather have some friendly guide to show you everything or would you rather have the adventure of travelling alone? (alone)
- CaE-21. QP VIIIb. Independent Self-Sufficiency. Do you usually tend to do your planning alone, without suggestions from, and discussions with, other people? (Yes)
- CaE-22. QP IX. Will Character. Would you rate yourself as above average in perseverance, i.e., in tendency to persist in an endeavor in spite of difficulties and distractions? (above average)
- CaE-23. QP IX. Do you generally succeed in keeping your emotions, of whatever kind, under very good control? (No)
- CaE-24. QP X. Obsessional-Inflexible Will-Character. Are you a person who is scrupulously correct in manners and social obligations (and like others to be the same)? (Yes)
- CaE-25. QP X. Are you inclined to be very careful and considerate of other people's feelings (e.g., avoiding the making of thoughtless remarks which you have later to regret)? (No)
- CaE-26. QP XI. Relaxed Independence. Are you well described as a happy-go-lucky, carefree, nonchalant person? (Yes)

- CaE-27. QP XI. Do you like plenty of excitement in life so that you experience a real craving for it in times of monotony? (No)
- CaE-28. QP XII. Variety-loving. Would you invariably prefer the type of job that offers constant change, travel and variety (in spite of other drawbacks)? (No)
- CaE-29. QP XII. Are you a talkative person, enjoying any opportunity for verbal expression? (Yes)
- CaE-30. QP XJII. Nervous Anxiety and Instability. Are you rather easily startled and distracted by sudden sourds, etc.? (Yes)
- CaE-31. QP XIII. Do you suffer from insomnia, or take an unduly long time to fall asleep at night? (Yes)
- CaE-32. QP XIV. High-strunguess. Do you think that, through tenseness, you seem to use up more energy than most people in getting things done? (Yes)
- CaE-33. QP XV. Paranoid Schizothyme. Do you believe that the majority of people, fundamentally are rather self-seeking and malicious? (Yes)
- CaE-34. QP XVI. Speed and Flexibility. Are you slow and deliberate in movement or do you move very quickly, rush from one activity to another, eat fast, etc.? (Deliberate, slow)
- CaE-35. QP XVII. Liking Thinking. Do you find it interesting to spend time analyzing people's motives? (No)
- CaE-36. QP XVII. Are you interested in serious problems of life and given to having long discussions on them with friends? (No)
- CaE-37. QP XVIII. Intellectual Leadership. Are you more interested in athletics than in intellectual matters? (Yes)
- CaE-38. QP XVIII. Do you tend to dislike being waited on in personal matters (i.e., by personal servants)? (No)
- CaE-39. QP XIX. Extravert-Alertness. Are you more alert than the average to what is going on around you, i.e., not absent-minded or neglectful of what people are thinking and doing? (No)
- CaE-40. QP XX. Interest in Action. Do you regard yourself as a practical man rather than a theorizer (e.g., you would rather do things than read about them)? (Fond of theory)
- CaE-41. Anxiety hysteria. Do you ever have a fit of anxiety or dread (perhaps with tremor or sweating) for no ascertainable reason? (Yes)
- CaE-42. Conversion hysteria. Have you ever been a sleep walker, or been known to do a good deal of talking in your sleep? (Yes)

- CaE-44. A, F, and H factors. When your friends consider some new undertaking do you generally take an optimistic view or do you tend to be doubtful, cautious and pessimistic? (cautious)
- CaE-45. I factor. On most social questions that come up for discussion are you regarded as a person who (a) takes a rather softhearted, perhaps impractically idealistic standpoint, or (b) a rather hardhearted, tough, practical attitude? (a)
- CaE-46. D, E, and L factors. Do you feel that on several occasions in recent years you have been found fault with more than you deserve? (Yes)
- CaE-47. QI Ia. Interest in People, Social Activity, Talking--v--Things,

 Detached Creative Interests. Underline two of the following occupations which you would find most congenial if salary and other conditions were about the same: Artist; Y.M.O.A. Secretary; Vacuum Cleaner Salesman; Physicist.

The following two items from the Allport-Vernon Interest-Values Test are considered likely to fall here:

- CaE-48. QI Ia and Analysis BrD V. Are you more interested in reading accounts of the lives and works of such men as (a)

 Aristotle, Plato and Socrates; (b) Alexander, Julius Caesar, and Charlemagne?
- CaE-49. QI Ia and Analysis BrD-VII. If you saw the following headlines of equal size in your morning paper, which would you read more attentively: (a) Threat to constitutional government in foreign country by dictator or (b) Physicists make important discovery concerning the electron.
- CaE-50. QI Ib. Guiding People for Their Own Presumed Good--v--Being Coldly Objective and Analysis BrD-II. The main object of scientific research should be the discovery of pure truth, for the pleasure of contemplation, rather than its practical application for industry or war. (Agree)
- CaE-51. QI Ib. Underline two of the following occupations which you find most congenial if salary and other conditions were about the same:

 Personnel Guidance Worker; Manager in manufacturing concern; Social Science Teacher; Engineer.
- CaE-52. QI IIa. Thoughtful Interest in Understanding Nature, Science,

 Theory--v-Political Interest. Underline two of the following occupations which you find most congenial if salary and other conditions were about the same: Office Manager; Banker;

 Architect; Chemist.
- CaE-53. QI IIa and BrD-VI. If the following headlines appeared in equal size in your newspaper, which would you attend to more:

 (a) Great Improvement in Market Conditions; (b) Protestant Leaders to Consult on Reconciliation?

- CaE-54. QI-11b. Altruism and Theoretical Interests and Analysis BrD-XI.

 The aim of the churches at the present time should be: (a) to bring out moral and charitable rendencies, and to urge people to think more of the good of other. (b) to convey spiritual worship, and a sense of communion with the highest. (b)
- CaE-55. QI IIb. Underline two of the following occupations which you rind most congenial if salary and other conditions were about the same: <u>Journalist</u>; Teacher; Manister; Real Estate Agent.
- CaE-56. QI IIIa. Verbal persuasion, Language, Aesthetic Interest, Theory-v--Practical Control of Materials, (Economic Interest? Political Interests?) Underline two of the following occupations which you find most congenial if salary and other conditions were about the same: advertising man; lawyer; waiter; carmenter; aviator; real estate salesman.
- CaE-57. QI IIIa and BrD-III. Would you encourage your children while at school, to (a) try to make several teams and liberal cultural recreational groups or (b) fit themselves as soon as possible by vocational training to be of use to society? (b)
- CaE-58. QI IVa. Phillistine Go-Getting, Business, Utility--v-Aesthetic,

 Aversion Business and Intellectual. Underline two of the following occupations which you find most congenial if salary and other
 conditions were about the same: Certified Public Accountant; Life
 Insurance Salesman; Farmer; Arrist.

The next five items complete the representation of the 11 Brogden Interest-Value factors mentioned above.

- Cak-59. QI IVa and BrD-X. If you should marry (or are married) do you prefer a wife who; (women should answer the alternative form immediately below)
 - A. Can achieve prestige, commanding admiration from others.
 - B. Is fundamentally spiritual in her attitude toward life.
 - C. Is gifted along artistic lines.

Check only one. (not A)

Do you prefer a husband who:

- A. Is successful in his profession, commanding admiration from others.
- B. Is fundamentally spiritual in his attitude toward life.
- $\overline{\mathbb{C}}$. Is gifted along artistic lines.

Check one. (not A)

Cak-60. QI IVa and Analysis BrD-I. If you had to hear a lecture or read a book on one of the following, which would you prefer:

(a) the comparative development of the great religious faiths, or: (b) the comparative merits of the forms of government in Britain and in the United States? (a)

- CaE-61. QI IVa and Analysis BrD-I. Which would you rather do on a free afternoon: (a) Enjoy the beauty of an art gallery or some fine scenery? (b) Enjoy a social meeting or a game of cards? (a)
- CaE-62. QI IVa and Analysis BrD-IV. If you lived in a small town and had more than enough income for your needs, would you prefer to: (a) apply it productively to industrial development; (b) help to endow the church to which you belong; (c) give it to a university for the development of scientific research; (d) devote it to hospitals? Check one only. (b)
- CaE-63. QI IVa and Analysis BrD-VIII. Do you prefer a friend (of your own sex) who: (a) is efficient, businesslike, self-reliant and of a practical turn of mind; (b) is seriously interested in thinking out his attitude to life as a whole? (b)
- CaE-64. QA Ia. Radicalism-Conservatism. Choose two of the following attitudes with which you most strongly agree and underline them.
 - 1. Divorce reform, in the direction of divorce simply by mutual consent, is desirable.
 - 2. There should be more strict observance of Sunday as a day of rest and churchgoing.
 - 3. The time has come for some sweeping economic reforms, involving the modification of individualistic capitalism by a government regulated or state controlled economy.
 - 4. Most "progressive" education methods are less sound than the old adage "spare the rod and spoil the child."
- CaE-65. QA Ia. Underline that one of the two attitudes here which better expresses your own sentiments.
 - Society should hasten progressive changes and innovations and throw aside outworn traditions and obstructive superstition.
 - 2. Society should be on guard against rash, headlong changes and when in doubt over old and new, should stick to what has been proven by the past.
- CaE-66. QA Ib. Fundamentalist Religious Beliefs. In any opposition between the scientific theory of evolution and the position of the church regarding the Old Testament and a personal God, I follow the former (evolution). (Agree)
- CaE-67. QA II. Hard-headed, Rational--v--Sentimental Emotional. Choose two of the following four attitudes with which you most strongly agree and underline them.
 - 1. Capital punishment of condemned criminals is something that should be entirely abolished.
 - 2. The sterilization of mental defectives and people carrying highly inheritable mental disease is a very reasonable and necessary social measure.

 68

- 3. Vaccination of children against the principal epidemic diseases should be carried out as a routine procedure when they first enter nursery school.
- 4. It would be an excellent thing if the use of alcohol and tobacco could be totally abolished.
- CaE-68. QA II. Society needs to be guided more by hard-headed, scientific, logical and rational considerations and less by emotional intuitions and sentimental feelings. (Disagree)
- CaE-69. QA III. Personal Liberty (Anarchy) -- v -- Coercion (Convention). Choose two of the following attitudes with which you most strongly agree and underline them.
 - 1. Forcible expropriation of certain individual property for the good of the state as a whole, e.g., by a communistic capital levy, is desirable.
 - 2. People should not be made ashamed of nudity but should be free to go unclothed where and when they think fit.
 - 3. Scientists should not allowed to make vivisection experiments except in extremely rare instances, supervised by representatives of the law.
 - 4. The sexual life of the individual is entirely his own concern and is no business of the state, the law or public opinion.
- CaE-70. QA III. We need more law and social authority, and the individual should learn to subordinate himself more to social regulation. (Agree)
- CaE-71. QA III. Do you think that (a) sometimes the only way to get things done at all is by violence, e.g., by war or revolution, or do you believe (b) that gradual methods, doing no harm to anyone, can be found? (a)
- CaE-72. Attitude toward the family. The stable family should be maintained as the basis of society; for one gets more happiness from deep family ties than through attachments dispersed over many friends and acquaintances. (Disagree)

Finally the following more miscellaneous items were added for various specific research interests.

- CaE-73. Racial characteristics have more real importance in shaping the individual and the nation than most people believe. (Disagree)
- CaE-74. Are you really fond of poetry, so that you would feel truly deprived if prevented from reading it? (Yes)
- CaE-75. If you have coffee (coca cola or tea also) rather late at night do you find that it prevents you from sleeping when you are ready for sleep? (Yes)

The following four items were inserted in the hope of tying in the factors found in "common annoyances" by Cason (see 3 and Harsh, 14, with the general personality factors).

"Below are four classes of common annoyances. Try to pick out two which annoy you most and underline them."

- CaE-76. The appearance of some people (e.g., wearing an ill-humored expression, dressing in a slovenly way, having decayed teeth, talking in a shrill voice). (Yes)
- CaE-77. Violating manners or morals (e.g., driving inconsiderately, public love-making, telling doubtful jokes when it embarrasses the company, getting drunk and annoying people). (No)
- CaE-78. People claiming to be very superior to others (e.g., bragging, having an affected manner, telling others how to do things better).

 (No)
- CaE-79. Unintentionally disagreeable acts (e.g., a person chewing gum loudly, having to wait for a person unavoidably late, a person harping constantly on one theme in conversation). (Yes)
- CaE-80. Sex of subject, male or female. (Male)

LOADINGS ON OBLIQUE FACTORS

- Anxiety-Depression or General Neuroticism
 Shyness
- 3. Interest in Understanding
- Nature 4. "Radicalism" and "Liking Thinking"

 5. Emotional Sensitive Self-
- Sufficiency vs. Gregarious-
- ness
 "Hard-headed Rationalism" and
 "Intellectual Leadership" 7. Independent Adventurous Self-
- Sufficiency 8. Will Control and Character Stability
- Social Poise and Belief in Coercion vs. Schizoid, Personal Liberty, and Autism

- 10. Relaxed Independence or Rhathymia

- 11. Hysterical, Surgent Nervousness
 12. Masculinity vs. Femininity
 13. Obsessionally Careful and Considerate
- 14. Hysteroid Aggressiveness
 15. Residual or "Interest in Guiding People" vs. "Objective Interests"
 16. Spurious Factor of "Annoyance at
- Appearances"
- 17. Conventional, Unimaginative Annoyance at Superiority18. Annoyance at Violation of Manners
- and Morals
- 19. Spurious Factor in "Annoyance" Scoring

ANALYSIS CaF

Cattell, R. B. The discovery of ergic structure in man in terms of common attitudes. J. abn. soc. Psychol., 1950, 45, 598-618.

The subjects were 160 married or engaged men between the ages of 23 and 35. This homogeneity of age, sex, and life situation was thought desirable for comparison of sentiments toward sweetheart and home.

The following Ergs and Sentiments were hypothetically represented by 2 or more variables:

Key Number	Ergs Represented	Key Number	Sentiments Represented
1	Self assertion (mastery, display)	1	To parents
2	Mating (sex)	2	Home (wife, fiancee)
3	Escape (fear)	3	Career (occupation)
3 4	Pugnacity (anger, aggression)	4	Money (bank account and salary)
5 6	Food seeking (hunger)	5	The Self
6	Parental protectiveness (tender emotion)	6	Religion (the Deity)
7	Gregariousness (loneliness)	7	Nation (patriotism)
8 9	Sleep (fatigue)	8	Political party
9	Curiosity (wonder)	9	University (as a student)
10	Appeal (despair, dependence)	10	Literature and drama (as recreation)
11	Self submission (negative self feeling)	11	Athletics (as recreation)
12	Play (phantasy, regression)		

The attitudes expressed in words corresponding with these ergs and sentiments are given as the variables below with the key numbers to identify the erg or sentiment. The score used in the analysis was a combination of the following three measurements:

- 1. The Preference Method. Each attitude (variable) was paired in turn with every other and the individual indicated which course of action and satisfaction he would prefer. The score for any attitude was the number of times it was chosen.
- 2. The Information Method. This method presented questions on facts that would come to be known by anyone who might be strongly and habitually interested in the given course of action, 10 questions for each attitude. Scores were ipsative, i.e., proportional to individuals total score.
- 3. The Psychogalvanic Reflex Method. This required each subject to sit for 2 hours in the P.G.R. circuit while some 500 stimuli were presented to him, 10 per attitude (scattered), 5 being opinions on facts pro and 5 contrathe given attitude, each stated in a few words or short sentence. The score was ipsative: i.e., expressed as a relation to the sigma of the individual's own range.

The intercorrelations among these diverse methods were all positive but low (mean with pool: preference .21, information .16, and P.G.R. .05). The P.G.R. score was given 2/3 the weight of each of the other 2.

In the list of variables below the key numbers in the right-hand columns indicate the ergs and sentiments which they represent.

		Erg	Sentiment
CaF - 1.	I like to take an active part in athletics and to get exercise.	-7,-8	11
CaF - 2.	I want America to get more protection against the terror of the atom bomb.	3	7
CaF - 3.	I like to see fine paintings, sculpture, art exhibits.	2,9,12	
CaF - +.	I want to see a reduction of income tax for people in my income bracket.	3 & all	4
CaF- 5.	I want to have my parents' advice, and to heed their wishes in planning my affairs.	10,11	1
CaF - 6.	I want to become proficient if possible excelling my colleagues in my chosen career.	1	3
CaF - 7.	I want to avoid ever becoming an insane patient in a mental hospital.	3	5
CaF - 8.	I like a novel with a love interest concerning a ravishingly attractive heroine.	2	10
CaF - 9.	I want to see any formidable militaristic power that actively threatens the U.S.A. attacked and destroyed.	3,4	7
CaF-10.	I want more time to enjoy sleep and rest.	8	
CaF-11.	I want to listen to music.	9 & others	
CaF-12.	I want to (be able to) spend more time at home (present home, not parents' home)	almost all	2
CaF -13,	I want never to do anything that would damage my sense of self respect	1	5
CaF -14.	I like to enjoy the spirit of comradeship that exists among my fellow students at the University of Illinois.	7	9
CaF-15.	I want to see our modern traveltraffic and planesmade less dangerous.	3,6	many
CaF -16.	I want to know more science.	9	R-C*
CaF -17.	I should like to see divorce made easier, e.g., by simple mutual consent.	2?	R-C*
CaF-18.	I want somehow to increase my salary.	6 & all	4,2

		Erg	Sentiment
CaF-19.	I want to see organized religion maintain or increase its influence.	10	6,R-C*
CaF-20.	I want the left right (underline one before proceeding) wing political party to gain at the next U. S. election.	1,-11	8,R-C*
CaF-21,	I want more time to enjoy my own company my own thoughts and reveries.	-7,12	5
CaF-22.	I want to attend football games and follow the fate of teams.	7	11
CaF-23.	I want to see those responsible for the present inflationmarket manipulators and othersseverely punished.	3,4	4,7
CaF-24.	I want to see more good restaurants, serving attractive meals, set up around this town.	5	5
CaF-25.	I should like to spend more time learning about and controlling mechanical things, engines, electrical gadgets.	9	
CaF -26.	I want to spend more money in insurance against illness and accident.	3	4
CaF-27.	I want America to be and remain the world's most powerful and influential country.	1,6,10	7
CaF-28.	I want to get a good reputation among those in my profession who can help my advance.	1,-11	3,5
CaF-29.	I like being on the fine campus, seeing the buildings, of the University of Illinois.	13	9
CaF-30.	I like to go to a good movie or play every week or so.	2,7,12	10
CaF-31.	I want to make love, to a woman I find . beautiful.	2	2
CaF-32.	I want to travel and explore unknown corners of the earth.	9,-7

The variables combine the \underline{Q} or \underline{A} method and two \underline{T} methods.

²Marital boredom.

The unrotated factor matrix providing communalities and the direction cosines among vectors are filed with the American Documentation Institute.

ANALYSIS CaG

Cattell, R. B. A factorization of tests of personality source traits. Brit. J. Psychol. Stat. Sec., 1951, 4, 165-173.

This was the second analysis of objective tests of personality (see Analysis CaD). This analysis includes two tests to mark each of the ll factors found in Analysis CaD. The subjects were those used in the earlier analyses. Since not all subjects took all of the tests, the correlation coefficients are based on a number of subjects varying from about 404 down to about 30. The multiple group centroid method was used.

- CaG-1. Fluency of Association. See CaD-3. Marker for CaD factor 6.
- CaG-2. Perseveration or Disposition Rigidity. See CaD-2. Marker for CaD factor 10.
- CaG- 3. Speed of Judgment. See CaD-5. Marker for CaD factor 11.
- CaG- 4. Slowness of Reaction Time. See CaD-4. Marker for CaD factor 9.
- CaG- 5. Ratio of Regularly Warned to Irregularly Warned Reaction Times. See CaD-22. Marker for CaD factor 9.
- CaG-6. Alternating Perspective (Cube Fluctuation). See CaD-19. Marker for CaD factor 4.
- CaG-7. Tempo. See CaD-18. Marker for CaD factor 1.
- CaG-8. Verbal and Numerical Ability on the A.C.E. Test. See CaD-1.

 Marker for CaD factor 6.
- CaG-9. Oscillation. See CaD-9. Marker for CaD factor 4 (and 1).
- CaG-10. Number of Jokes Considered Funny. See CaD-21. Marker for CaD factor 1.
- CaG-11. Absence of Questionable Preferences in Reading. See CaD-17. Marker for CaD factor 2 (and 3).
- CaG-12. Ratio Purposeful to Chance Observation and Memory. See CaD-38. Marker for CaD factor 7 (and 11).
- CaG-13. Impairment of Mental Performance by Embarrassing Emotion. See CaD-25. Marker for CaD factor 8.
- CaG-14. Immaturity of Opinion. See CaD-48. Marker for CaD factor 8.
- CaG-15. Suggestibility to Authority. See CaD-14. Marker for CaD factor 8.
- CaG-16. Ability to State Logical Assumptions. See CaD-42. Marker for CaD factor 3.
- CaG-17. Ability to Suggest Classifications. See CaD-46. Marker for CaD factor 3.

- CaG-18. Ratio Consonant to Dissonant Statements Recalled. See CaD-36. Marker for CaD factor 5.
- CaG-19. Colour-Form Ratio in Sorting. See CaD-23. Marker for CaD factor 5.
- CaG-?0. Two Hand Coordination. See CaD-20. Marker for CaD factor 7.
- CaG-21. Body-Sway Suggestibility. See CaD-26. Marker for CaD factor 10.
- CaG-22. Magnitude of Mean P.G.R. Deflection. See CaD-37. Marker for CaD factor 2.
- CaG-23. Ratio of Higher to Lower Mental Set Performance. The task requires maintenance of set at three levels: (1) to read every other word in a passage (arranged to make sense); (2) to note for reproduction all objects mentioned in certain categories (colours, personal characteristics); (3) to note objects simultaneously falling in three of these categoried. The subject is scored on ratio of success in highest to other two tasks. Theory is that schizoid (Cattellic A-factor) person will do less well on higher sets.
- CaG-24. Alertness in Following Directions. The subject is here scored on sum of successful observations (recalled immediately after the performance) in CaG-2 and CaG-3 above. The hypothesis is that high on Cattell's G factor (5) will be associated with care and conscientiousness in this alertness-demanding situation.
- CaG-25. Index of Carefulness. Also derived from CaG-23. The subject is scored in middle and upper sets on the number of instances wrongly categorizes. The raw score is inverted to give 'carefulness' not errors. Assumed to express both Cattell's F- and G+ factors.
- CaG-26. Tendency to Remember Easier Tasks. The subject is asked to solve two pages of riddles, those on one page being more difficult than the next. The score is number recalled after difficult page minus number recalled after easy page. Presumed to test dominance factor.
- CaG-27. Ratio of Self-Criticism to Self-Approval. The subject writes down in one minute single words or short phrases describing his undesirable and desirable characteristics. The ratio is number of self-criticisms to number of self-approvals. Presumed to test Cattell's factors A- or E+.
- CaG-28. Lack of Planning Ability. Two tasks used: making words from groups of letters and picking, from 9 numbers, pairs that would sum to a given number. The composite score was based on how evenly the subject distributed his efforts, how much he used scratch paper, and how systematic he was in the arithmetical section. Deliberation and planning conduces to a low score. Possibly a test of Cattell's factors C, G, or I.

- CaG-30. Sympathetic Increase in Emotional Associated as CaG-29 was in 2 parts with a story of fear interposed. This score was the number of emotional words chosen on the second page minus the number of emotional words chosen on the fit page. Assumed to test Cattell's A+ or C- factor.
- CaG-31. Sympathetic Increase in Emotional Recall. A . If words, some emotional and some matter of fact, was presented: the subject then recalled them 3 times, (i) directly after presentation, (ii) after reading a 'fearful' story, and (iii) after reading several jokes. The increase in number of emotional words recalled was measured.
- CaG-32. Ratio Emotional to Non-Emotional Recall. In the preceding test the ratio of emotional to non-emotional words recalled was taken for the first situation (before sympathetic effect).

 Assumed to test Cattell's H factor.
- CaG-33. Myokinesis Drift. The subjects were asked to draw two series of ten vertical lines. The distance of the base line of these lines from a horizontal line through the starting point at a point 6 ins. along the base line is the measure of drift; upward drift is positive. Assumed to test Cattell's C factor.
- CaG-34. Effect of Tempting Distraction upon Recall. A scientific passage was read by the subject, and he was tested on recall of what he had read. After reading to the middle of an interesting story the subject was again tested for knowledge of the passage. The score was number of correct answers to first test minus number of correct answers to second. A negative or low positive score indicates no distraction. Assumed to measure poor personality integration, i.e., low on Cattell's G factor.
- CaG-35. Influence of Unrelated Frustration on Recall. Instead of finishing the interesting story the subject was given another task and then questioned on the original passage. This interruption was quite frustrating. The score was the number of correct answers to the first test minus the number of correct answers to this. Intended as a measure of Cattell's C factor.
- CaG-36. Influence of Frustration on Judgment. This was two separate pages of judgment tests (underlining the word that did not belong). The second page followed the frustrating situation in CaG-35. The score was for correct answers on the first page minus the number on the second page (after frustration). Intended as a measure of the emotionality of Cattell's C and D factors, mostly the latter.

CaG

- CaG-37. Ratio of Emotionally Interesting to Non-Emotional (Dry) Reading Speed. The number of words read in an interesting story was divided by the ..umber read in the same length of time in a scientific passage. It was assumed that an individual high on Cattell's G would maintain good speed in the uninteresting material.
- CaG-J3. Masculinity versus Femininity. Terman and Miles Attitude-Interest Analysis Test. Terman and Miles' weighted scores were used. Inserted to explore possibility that Cattell's I factor may be masculinity. See Analysis FT.
- CaG-39. Sex of Student (Positive for Male).
- CaG-40. Poor Logical Consistency. In this test the subject expressed his attitudes on a wide range of issues. The attitude or belief statements dispersed through the Lest could be gathered together in groups of 3, deliberately designed to present the logical coherence of a first and second premise and conclusion in a syllogism. The subject was scored on the number of consistent syllogisms. It is assumed that the low integration of Cattell's C factor will show itself in an occasional need to accept logically inconsistent views.
- CaG-41. Imaginative Synasthesia. Modernistic drawings were presented to the subject along with a series of abstract terms, e.g., coyness, boredom, doubt, etc., which the artist (Abner Dean) had used as titles for his drawings. The subject was asked to choose the best title. It is assumed that this artistic sensitivity is the essence of Cattell's I factor. See CT-3.
- CaG-42. Immoderation of Statement. In CaG-14, 15, 40 and 45 the subject was scored for the number of extreme answers ('absolutely certain' and 'absurd or stupid').
- CaG-43. Personal Excuses. At the end of the testing week the subject was asked to list ways in which various tests and ratings might be 'unfair' to him. The score: number of excuses.
- CaG-44. Extra-Punitive Criticisms. The subject was asked for criticisms of the tests in general. Score: the number of remarks blaming examiner or external circumstances for anticipated poor score.
- CaG-45. Tendency to Agree with Majority. Statements by authorities were given and below each were presented the percentage of students agreeing and disagreeing. Score: number of times the subject agreed with higher percentage. (Overlaps with CaG-15.)
- CaG-46. After-Image Time. This was the length of time between the disappearance of the positive after-image and the appearance of the negative after-image (indicated by the subject pressing a key). There were 4 trials in a dark box after standard exposure. Assumed that in neurasthenia after-images are unduly long, and perhaps affected by desurgency.

CaG

- CaG-47. Erroneous Reactions when Maintaining Complex Mental Sets. The subject reacts to a complex set of lights and buzzers by pressing a key with his left or right hand, or not at all, according to the sequence. Score: number of errors. Assumed to measure high excitability and low frustration tolerance.
- CaG-48. Slowing of Reaction Time by Complex Instructions. The reaction time for correct reaction in the above complex task was divided by the subject's normal, simple reaction time to visual and auditory stimuli. Possibly an expression of the general level of inhibition and therefore of Cattell's F factor.
- CaG-49. Healthy Schneider Index. The usual composite index of changes in pulse rate and blood pressure from lying down to standing and time to return to normal after exercise. Added for evidence on psychosomatic theories.
- CaG-50. Basal Metabolic Rate. The subject's smallest 0 consumption for 4 runs (6 minutes each), converted to calories/hr./sq. metre of body area by reference to sex-age tables. Introduced to test relations with Cattell's H factor.
- CaG-51. Metabolic Rate Change with Stimulation. Measured under 3 types of stimulation: unusual arithmetic problems, muscular work (ergograph), and emotional stimulation (electric shock and loud noise). Intended as a measure of sympathetic reactivity, hypothesized as Cattell's D or H'factors.
- CaG-52. Pitch of Voice. While the subject was answering questions his voice was matched for essential pitch with one of 9 grades on a standard voice record.
- CaG-53. Salivary pH. The subject accumulated saliva for 1 minute. pH was read 1 minute after ejection on the usual electrical pH meter.
- CaG-54. Lack of Muscle Tonus. While the subject was reading, his left arm rests on a trolley. The arm was suddenly snatched backwards by a falling weight attached to the trolley and the distance the arm moved was recorded by a stylus tracing interrupted after 1/5 second. Designed to measure resting muscle tonus, as representing a temperament factor, probably Cattell's J.
- CaG-55. Eidetic Imagery. Following Allport's findings, eidetic imagery proneness is measured with eight pictures chosen for subtlety of colour and form, Points given for externalizing and locating the picture, sensations of eye accommodation, etc., colour minus pure form, non-verbalizable form minus verbalizable form. The subtractions ruled out goodness of memory. Hypothesis: that Jaensch's types may be unitary personality factors already known.

- CaG-56. P.G.R. Upward Drift. After a task in which the subject was shocked, shock apparatus was disconnected and the subject was assured he could relax. The P.G.R. upward drift for 3 minutes was recorded. Hypothesis: measures of cyclothyme's trustful readiness to relax (Cattell's A+ or L- factor).
- CaG-57. Improvement (Learning) in Mirror Tracing under Stimulation.

 Three trials were given the subject on each of 3 patterns.

 In the second trial the subjects were shocked for poor performance. Shock was also administered on the first pattern of the third trial. The second pattern was done without mirror, as a control measure of dexterity. The score was reduction of error score between first and third performance. Hypothesis: that sheer mirror drawing ability is cancelled by the comparison and this represents effective performance under stress or strength of escape motivation.
- CaG-58. Carelessness over Following Instructions. Number of slips made by the subject on 3 mirror tracings and 3 ordinary tracings of designs. Hypothesis: that carefulness measures G factor.
- CaG-59. Impairment of Performance by Fright. Three equally difficult finger mazes, the first done under normal conditions, the last two under conditions of fright (electric shocks on maze 2 and a rat and some cockroaches in the cage surrounding the maze 3). The score was the turns per minute for maze 1 divided by the turns per minute in mazes 2 and 3. Intended to test the emotionality factors.
- CaG-60. Speed on Finger Maze. Number of turns per minute on five finger mazes. Intended to measure readiness for trial-and-error in H factor.
- CaG-61. Fidgetometer Frequency. A pneumatic instrument shows number of body movements per minute on a moving drum, expecially of leg and foot. The score was movements per minute during test 55. Hypothesis: muscle tension in a standard situation more sensitive than P.G.R., especially for tension of schizothyme.
- CaG-62. Increase of Pulse Rate in Stress. Difference in normal P.R. and the P.R. after the frightening mirror tracing shock-situation was recorded. Presumed to measure Cattell's D or I factor.
- CaG-63. Loss of Recall from Frustration and Humiliation. The subject memorizes two lists of phrases and recalls each after interpolated activity. Score: difference in number of phrases recalled after a neutral experience (easy riddles) and after a frustrating or humiliating task. Hypothesis: an inverted measure of ego strength, i.e., of Cattell's C factor.

CaG-64. Sympathetic Increase in Timidity Associations. Similar to CaG-30 except that only the increase in associative words appropriate to a fear emotion was counted. Hypothesis: a measure of Cattell's H- factor, indicating proneness to timid withdrawal responses.

Note.--Variables 26, 27, 32, 34, 36, 38, and 41 are retained in the matrix for hyperplane but not involved in any definition or discussion of factors beyond this point because of the negligible reliability which they proved to have.

ANALYSIS CD

Crissy, W. J. E., and Daniel, W. J. Vocational interest factors in women. J. app. Psychol., 1939, 23, 488-494.

The data used in this analysis were the intercorrelations for 500 married women reported by E. K. Strong in the manual of his Vocational Interest Blank for Women. See Analysis Sg. The names of the scales used for variables appear in the table of loadings. For purposes of this survey these variables will be considered parallel to those in the blank for men when the names are the same. (YMCA will be considered parallel to YWCA.)

LOADINGS ON ORTHOGONAL FACTORS

MA. Interest in male association

T. Interest in language

P. Interest in people

S. Interest in science

ANALYSIS CE

Cattell, R. B. The diagnosis and classification of neurotic states: a re-interpretation of Eysenck's factors. J. nerv. ment. Dis., 1945, 102, 576-589. This study consists of rotation and re-interpretation of the factors obtained by Eysenck, Analysis Ey. The variables are described more fully in that analysis.

LOADINGS ON OBLIQUE FACTORS

- I. A combination of <u>C</u>, Emotionally Stable Character vs. Demoralized General Emotionality, and <u>G</u>, Positive Character Integration, vs. Immature Dependent Character, both with loads in reverse.
- III. B, General Mental Capacity in Personality vs. Mental Defect
- II. Probably <u>I</u>, Sensitive, Imaginative, Anxious Emotionality

ANALYSIS Ch

Carlson, H. B. Attitudes of Undergraduate Students. <u>J. soc. Psychol.</u>, 1934, 5, 202-212.

The subjects were seniors of the class of 1932 at the University of Chicago. 500 attitude scales were distributed and complete records were obtained for 215. The attitude scores used were those on L. L. Thurstone's attitude scales. Each scale consists of 20 or 22 statements which express gradations of thought and feeling from one extreme to another. Each statement has a scale value determined by its average placement on an 11-point scale by judges. The subject was asked to put a check mark if he agreed with the statement, to put a cross if he disagreed with the statement, and to put a question mark if he could not decide about any particular statement. A subject's score was the median scale value of all the statements that he endorsed. One orthogonal rotation was made.

The variables consist of the attitude scales named in the table (a favorable attitude toward the concept named is scored positively) and the Chicago entrance psychological examination which had been taken by 100 of the subjects.

ANALYSIS CM

Cattell, R. B., and Miller, A. A confirmation of the ergic and self-sentiment patterns among dynamic traits (attitude variables) by R-technique. Brit. J. Psychol., 1952, 43, 280-294.

The subjects were 73 undergraduate men.

The analysis is comparable to Analysis CaF in its general method. It uses the Preference Method and the Information Method of measurement described there, and, instead of the Psychogalvanic Reflex Method it uses the Fluency Method. In this situation the subject was given the sentence defining the attitude and asked to write as many justifications for the attitude (including further satisfactions to which it would lead) as possible in each of two l-minute periods. The total number of ideas per attitude was ipsatively scored to cancel individual differences in total fluency. Where the correlations between the three measurements of each attitude were unsatisfactory (insignificant or negative) the score was based on the Preference test alone. This occurred for variables 5, 8, 10, 15, 16, 21, 26, and 29.

The variables used in this study are the ones with the best loadings on each of the factors found in <u>Analysis CaF</u>, plus variables that were devised to fit the ir rpretation of each of those factors best. The following are variables that were not used in <u>Analysis CaF</u>. The <u>CaF</u> numbers for the others are given in the table of loadings.

- CM- 4. I want to help the distressed wherever they are.
- CM- 7. I like sex appeal in a woman.
- CM-10. I would rather spend free time with people than by myself.
- CM-13. I like to know a sure place to turn for help when difficulties become too overwhelming.
- CM-17. I would like to satisfy my curiosity about everything around.
- CM-20. I want to see the danger of death by accidents and disease reduced.
- CM-23. I like to enjoy the luxury of my bath at leisure.
- CM-24. I want more time to enjoy my own company, my own thoughts and reveries.
- CM-27. I like to keep good control over my mental processes, e.g. memory.
- CM-30. I like to have command of people.

ANALYSIS Co

Cottle, W. C. A factorial study of the Multiphasic, Strong, Kuder, and Bell inventories using a population of adult males. <u>Psychouetrika</u>, 1950, <u>15</u>, 25-47.

The subjects were 400 male veterans of World War II who were referred for testing and counseling at the Psychological Services Jenter of Syracuse University under the Veterans testing program. They seemed to be a fairly normal sample of college men.

Minnesota Multiphasic Personality inventory. 564 items of the questionnaire type are written on individual cards. The subject sorts the cards into piles representing the responses "Yes," "?," and "No." Cases with more than 20 responses of "?" or with raw scores greater than 9 on the lie scale (L) or validity scale (F) were eliminated from the sample.

- Co-1. L, Lie Factor. Amount of falsification of scores made by choosing the most socially accepted responses. It reveals exaggeration or misrepresentation.
- Co-2. F, Validity. Check on validity of test-rationale. Scores are high if scoring is careless or if the subject is careless, fails to follow directions or for any reason makes responses that are not pertinent.
 - K Scale. (Included here for purposes of completion only. See WL2) This is a correction factor found to be of value in sharpening the discriminatory power of the clinical variables. Persons who are motivated toward getting "good" scores (defensiveness) will tend toward higher scores on K, and those desiring "poor" scores (plus getting) will obtain lower values.
- Co-3. Hs, Hypochondriasis. Amount of abnormal concern about bodily functions, concern about health, tendency toward physical complaint.
- Co- 4. D. Depression. Depth of clinically recognized symptom complex, depression in terms of poor morale of the emotional type with a feeling of uselessness and inability to assume a normal optimism with regard to the future. Dejection despondency.
- Co-5. Hy, Hysteria. The degree to which the subject is like patients who have developed conversion-type hysterical symptoms like systematic or specific complaints. Immature, unrealistic, amenable to group ideas, kindly, courteous, naive, needs social acceptance.
- Co-6. Pd, Psychopathic Deviate. Absence of deep emotional response, inability to profit from experience, and disregard of social mores. Irresponsible, impulsive, egocentric, defiant, asocial, individualistic.
- Co- 7. Mf, Masculinity-Femininity. Tendency toward feminine interests.
- Co-8. <u>Pa, Paranoia</u>. Tendency toward suspiciousness, over-sensitivity, delusions of persecution. Aggressive, critical, irritable, moody, sensitive to criticism.

4

- Co- 9. Pt, Psychasthenia. Tendency to be troubled by phobias or compulsive behavior. Apprehensive, tense, hesitant, insecure, self-conscious, feelings of inadequacy.
- Co-10. Sc, Schizophrenia. Tendency to be characterized by bizarre and unusual thoughts or behavior such as a splitting of the subjective life of the schizophrenic person from reality so that the observer cannot rationally follow the shifts in mood and behavior. Bashful, withdrawn, oversensitive, secretive, cautious.
- Co-ll. Ma, Hypomania. Marked over-productivity in thought and action, undertaking too many things, too active, too enthusiastic. Confident, hypersensitive, not persistent, aggressive, charming, expansive. Social Scales: See Analysis Ty.
- Strong Vocational Interest Blank for Men. See Analysis Sg.
- Co-12. I, Scientific. Representative of interests of artist, psychologist, architect, physician, dentiat.
- Co-13. <u>II, Technical</u>. Representative of interests of mathematician, engineer, chemist, physicist.
- Co-14. V, Social Welfare. Representative of interests of YMCA physical director and secretary, personnel manager, social science teacher, city school superintendent, minister.
- Co-15. VIII, Business Detail. Representative of interests of accountant, office worker, purchasing agent, banker.
- Co-16. IX, Business Contact. Representative of interests of sales manager, realtor, life insurance salesman.
- Co-17. X, Linguistic. Representative of interests of advertising man, lawyer, author-journalist.
- Co-18. IM, Interest Maturity. Difference in interest with age as associated with various occupational interests.
- Co-19. OL, Occupational Level. Interest consistent with varying levels of aspiration or occupations.
- Co-20. MF, Masculinity-Femininity. Interest in things and objects vs. people and ideas.

Kuder Preference Record. This is an inventory having 168 items. Each item consists of the name or short description of three, usually related, activities. The subject indicates by punching a hole with a stylus which of the three activities he likes most, and which he likes least. The stylus makes a hole through sheets such that the score for each of the scales below is obtained by counting the punctures that occur in printed circles.

- Co-21. M, Mechanical. Degree of interest in mechanical activities.
- Co-22. C, Computational. Degree of interest in computational activities.
- Co-23. S, Scientific. Degree of interest in scientific activities.
- Co-24. P. Persuasive. Degree of interest in persuasive activities (business contact).
- Co-25. A, Artistic. Degree of interest in artistic activities.
- Co-26. L, Literary. Degree of interest in literary activities.
- Co-27. M, Musical. Degree of interest in musical activities.
- Co-28. SS, Social Service. Degree of interest in social service activities.
- Co-29. Cl, Clerical. Degree of interest in clerical activities.
- Co-30. Mf, Masculinity-Femininity. Greatest differentiation of the two sexes, computed according to the procedure given in Kuder's revised manual, 1946.

Bell Adjustment Inventory, student form. This is a 140-item Yes-?-No questionnaire, with items asking about habits, feelings, attitudes, etc. relevant to the categories below. Scoring is done by placing over the responses tracing paper sheets on which are indicated the response positions for each scale. One point is given for each response coinciding with the key.

- Co-31. Ho, Home. High scores indicate unsatisfactory home adjustment.
- Co-32. He, Health. High scores indicate unsatisfactory health adjustment.
- Co-33. So, Social. High scores indicate persons submissive and retiring in social contact.
- Co-34. Em, Emotional. High scores indicate individuals who tend to be unstable emotionally.

LOADINGS ON OBLIQUE FACTORS

- A. Verbalization, communication or "people."
- B. Expression of more serious maladjusted tendencies.
- C. Interest in routine activities vs. those of a varied nature.
- D. Hypochondriasis or neurotic tendencies.
- E. Residual.
- F. Liking for contact with people vs. scientific activities.
- G. Esteem of leadership.
- H. Preference for "social welfare" activities.

ANALYSIS CP

Carter, H. D., Pyles, M. K., and Brethall, E. P. A comparative study of factors in vocational interest scores of high school boys. J. educ. Psychol., 1935, 26, 81-98.

The subjects were 133 high school boys ranging in age from 12 to 20. They were given the Strong Vocational Interest Blank which is designed for older persons (see Analysis Sg).

Two analyses were made using Thurstone's simplified method. No rotation of axes is necessary for this method. Only the first analysis, which used 23 vocational scores and age, is reported here. The second analysis used only the 18 vocational scores used by Thurstone. In both analyses four factors were extracted and were found to be closely similar. A table showing the correlation of the ranks of the loadings on each factor indicates a considerable degree of agreement between these analyses and that of Thurstone.

ANALYSIS CSA

Cattell, R. B., and Saunders, D. R. Inter-relation and matching of personality factors from behavior rating, questionnaire, and objective test data. J. soc. Psychol., 1950, 31, 243-260.

This analysis used variables from Analyses CaB, CaC, CaD, and CaE to find out whether factors of similar psychological meaning found separately for different media will turn out to be in fact the same factors. This approach was possible, since these earlier analyses all made use of the same subjects, 404 college students, about two thirds women, at the University of Illinois, who were paid to be subjects. In the present analysis each factor found earlier is represented one or more times by combining the scores on variables having high loadings on it. Since all measures were not obtained for every subject, the correlations are based on varying sized groups. Tetrachoric correlations are used as this brought about desirable normalizing.

The list of variables indicates the factor being represented, with Cattell's code numbers, the number of cases, and the variables from the earlier analyses that were combined. (The variable numbers are those used in this book. These are different variable numbers from those used by Cattell for Analyses CaD and CaE.)

Since the variables are too complex to be indicated in the table of loadings, the factor or factors which they represent is indicated by this book's identification of it.

ANALYSIS CT

Cattell, R. B., and Tiner, L. G. The varieties of structural rigidity. J. Personality, 1949, 17, 321-341.

The subjects were 100 male college students.

- CT-1. Weigl Figures. The test consisted of 5 plates as used in an earlier research. Each could be seen as a face both when held right side up and when reversed. The subject was asked to say if he could see the faces and to describe them. Scoring was in terms of whether or not the subject saw the face both right side up and upside down. Low scores would be indicative of high rigidity.
- CT- 2. Creative Effort Motor Perseveration Test. Four measures of the creative effort type found well saturated in a previous factorization were included in the battery. Total time was only 160 seconds. Each test was in the form of an old type of activity directly followed by a new type of activity. Each test was scored in terms of speed in the old activity divided by the new activity.
- CT- 3. Imaginative "Synestnesia." The subject was presented with 12 outline drawings of abstract forms and a list of 12 "traits." He was required to match each trait with a drawing. Time: 2 minutes. The score was the number correctly matched. This is a new test, testing the hypothesis that the high "plasticity" and far-fetched imagination required to see some connection between the drawings would arise from low rigidity.
- CT- 4. Gottschaldt's Figures. This was a page of 16 Gottschaldt figures.
 Four minutes was allowed for the test. The score was the number of larger, more complicated figures in which a smaller, simpler design was found and penciled in. It was thought that rigidity might have some influence in obstructing the perception of forms in the larger units.
- CT- 5. The Necker Cube. The subject was told to fix his attention on the center of a fluctuating outline cube and to make a note of the number of times a shift in perspective occurred. The number of fluctuations constituted the score. This was included because it has been claimed, probably mistakenly, that inability to see rapid fluctuations is a measure of rigidity.
- CT- 6. The Werner Tone Rhythm Series. The subject was presented with 12 series of long and short sounds. After each sound series he was asked to write down what he had heard. The test was scored in terms of the number of errors made. Fewer errors were indicative of low rigidity if it may be assumed, as Werner assumes, that these errors are of a perseverative nature.
- CT-7. Riddles. Eight riddles were selected on the basis of their having two possible solutions. One was of a serious and obvious nature, the other was a unique witty solution. Two minutes was taken for the test. The score was the total number of unique witty solutions given. The more rigid person would give the serious, obvious solution, and the less rigid person would give the unique witty answer.

- CT- 8. Distraction Test. The subject was presented with a page of simple addition problems. He worked for 2 minutes in silence followed by a period of 2 minutes during which a loud and humorous distraction took place. After this he worked 2 minutes more in silence. The score was the average of the number of problems correctly done in the pre- and post-distraction periods as compared to the number of problems correctly done during the distraction period. More distracted persons therefore had higher scores. It is possible that persons low in rigidity are more distractible than more rigid persons.
- CT-9. Flicker Fusion. An instrument (Strobotac) was used which enabled the experimenter to regulate the frequency of flicker. The machine was started at the lowest frequency and gradually raised through 13 critical periods to the highest frequency (a). Then the reverse procedure was carried out starting at the highest frequency and going to the lowest (b). The entire procedure was then repeated to get measures (c) and (d). (a + c) and (b + d) were averaged and treated as one score. The test was scored in terms of the critical period at which the flicker disappeared and that at which the flicker reappeared. (High scores represent long period, low frequency.) This was inserted to answer the much debated question of whether the classical rigidity extends to perceptual activities.
- CT-10. Fusion Lag. This test was derived directly from the experimental results of CT-9. It was assumed that the difference between part (a + b) and part (c + d) would give a measure of the lag in perceiving change in flicker which we have called Fusion Lag. This may be more readily understood by:
 - $\frac{a + (b 13)}{2} \frac{c + (d 13)}{2} = Fusion Lag; (b and c should probably be interchanged)$
- CT-11. Fluency. Two drawings and 2 ink blots were presented to the subject. He was asked to list the number of things which could be lying at a certain place in the drawings. In the case of the ink blots he was asked what they suggested to him. The score was the number of responses given for each picture. Low fluency should produce more rigid behavior though it is itself not rigidity.
- CT-12. Thurstone's Flag Test. The subject was presented with the first page of standard instructions and was then instructed to work on the last page of the test which had been reproduced in the test booklet. The number of flags marked correctly was the total score. It was included in this test battery in order to study the relationship of spatial ability to perseveration, fluency, and intelligence.

- CT-13. Hidden Objects. The subject was presented with 2 pictures in which there were numerous hidden objects. The pictures were of the type found in children's magazines. The subject was instructed to find as many hidden objects as possible and to list them below the picture. The total number of legitimate hidden objects found was the correct score. It was supposed that more rigid persons would find fewer hidden objects.
- Hidden Word Test. The subject was presented with 12 ambiguous words. He was instructed to find only one 4- or 5-letter hidden word in each ambiguous word without transposing the letters. The first 3 words were worked out with the subject. In each case the hidden word was the name of an animal. The score was the total number of animal names found. This test was included in the battery as a measure of mental set in order better to understand what relationship it bears to perseveration. The set was established by working out 3 animal names hidden in words with the subject. Luchins, in designing the test, assumed that subjects who found animal names had established set, whereas those who were unable to find animal names did not establish set. We did not find it to work in this way, and it had to be scored simply as an anagrams test.
- CT-15. Nonsense Syllables. The subject was instructed to make up as many completely meaningless, pronounceable, one syllable words as possible. The time allowed was 1 minute. The number of words fulfilling the above mentioned criteria was the total score. This is a newly invented test for this study. Although it clearly involves fluency, it also comes so near to what we have discussed as plasticity or low basic rigidity that it justifies inclusion.
- CT-16. Clinical Test. The subject was presented with 3 printed designs and 3 envelopes containing squares to be used in constructing designs similar to the printed ones. In each case there were an insufficient number of squares with which to make up the design although they were so constructed that this was not readily apparent. The number of envelopes opened, and the number of moves made constituted 2 separate scores on the test. This test was designed to measure a "clinical type of perseveration." It was designed to measure the tendency to go on repeating an approach to a problem in spite of nonsolution.
- CT-17. The Cattell Culture-Free Test of Intelligence. The following four parts of the test were administered:

Part I. Classifications (7 minutes)

Part IV. Matrices I: Four-Item Relational (4 minutes)

Part V. Matrices II: Nine-Item Relational (5 minutes)

Part VI. Matrices III: Nine-Item Cyclical (13 minutes)

Parts II and III were deleted for lack of time, and also the time limits for the four parts used were slightly shortened. The total time required for the test was 23 minutes plus time required for reading the directions. The majority of the subjects had no difficulty in finishing the test within the time limits. The standard directions and standard test booklet were used. The tests were scored in the standard manner. It was thought necessary to include a standardized intelligence test in the battery in order to find the relation of intelligence to perseveration.

ANALYSIS CW

Cook, E. B., and Wherry, R. J. A factor analysis of MMPI and aptitude test data. J. appl. Psychol., 1950, 34, 260-266.

The subjects were lll naval enlisted submarine candidates. Three others had been eliminated, since their "Lie" score indicated that their MMPI scores would be invalid. The analysis used a modified Thurstone Group Centroid method.

Variables 1-11 were the scales of the short group form of the Minnesota Multiphasic Personality Inventory (see Analysis Co). The names of the scales appear in the table of loadings.

CW-12. Two-Hand Coordination Test. This was a motor pursuit task which had been employed frequently in the selection of military personnel. The essential psychological principle involved the carrying out of two coordinated movements simultaneously so that there was a conflict of attention. The subject was rated on his ability to manipulate hand cranks in such a way as to keep a small button in continuous contact with an irregularly moving disc. An electrically operated stop clock measured the total amount of time during which actual contact was maintained. Two 1-minute trials were used.

Variables 13-17 were the subtests of the Navy Basic Battery as follows:

- .CW-13. General Classification Test. Verbal abilities.
- CW-14. Arithmetical Reasoning. Fractions, percentages, proportions.
- CW-15. Mechanical Aptitude. Pictures applying simple principles of physics--levers, pulleys, braces, etc.
- CW-16. Mechanical Knowledge. Picture identification tests.
- CW-17. Electrical Knowledge. Picture identification tests.
- CW-18. Tank Performance. Subjects were rated on a 5-point scale by a submarine medical officer for their over-all performance while undergoing routine training procedures at the Escape Training Tank. Subjects made two underwater ascents from each of the 12', 18' and 50' depths. They were rated on such items as evidence of apprehension, quickness of response to instructions, errors of position on the line, "freezing" on the line, fighting to get out of the water too quickly, and so forth.

Variables 19 and 20 were the two sections of the <u>Navy Enlisted Personal</u>
<u>Inventory</u>. This consisted of form 2 of the Personal Inventory, a group test
which presented a standardized psychiatric interview in pencil and paper form.
The forced-choice type items which comprise the inventory were based on case
history dissimilarities between psychiatrically undesirable and normal military personnel. Scores on the two sections (personal history and medical
history) were treated as separate variables.

ANALYSIS DT

Denton, J. C., and Taylor, C. W. A factor analysis of mental abilities and personality traits. Unpublished.

The subjects were 170 high-school seniors in Washington, D. C. Scores on variables 1-8 were normalized.

- DT-1. Memory. Combined scores on (a) First Names: recall first names paired with given last names, and (b) Word-Number: recall 2-digit numbers paired with given words.
- DT-2. Perceptual Speed. Identical Numbers: cross out numbers in a column which are the same as the one at the top.
- DT-3. Reasoning. Combined scores on (a) Letter Series: indicate which 2 letters come next in a series, (b) Letter Grouping: indicate which of 4 groups of letters is different from the other 3.
- DT-4. Number. Combined scores on (a) Addition: determine the correctness of an answer to a simple addition problem, (b) Multiplication: determine the correctness of a product of a two-digit and a one-digit number.
- DT-5. Verbal Comprehension. Combined scores on (a) Same or Opposite: select a word which means the same as, or opposite of, a given word, (b) Completion: select the first letter of a word that would complete a sentence.
- DT-6. Word Fluency. Combined scores on (a) First and Last Letters: write words that begin and end with given letters, (b) Suffixes: write words that have a given suffix.
- DT-7. Verbal Versatility. Combined scores on (a) Similies: write three ways in which a similie could be completed, (b) Letter Star: write a meaningful phrase or sentence that fits a given set of letters and stars, such as * Y * S. Each letter or star represents a word, which begins with the given letter or, in case of a star, with any letter.
- DT-8. Ideational Fluency. Combined scores on (a) Topics: write a phrase or sentence, regardless of quality, about a given topic, (b) Theme: write a theme about a given vague topic.
- DT- 9 through 13. Guilford's factors S, T, D, C, and R. See Lo-1-5.

² Memory, see Psychometric Monograph, No. 5.

³Variables 9 and 13 have gone together in <u>Analyses Lo</u>, No and <u>ThB</u> but with various other measures. Elements of <u>Su</u> and <u>So</u> are probably involved as well as <u>Rh</u>.

ANALYSIS Du

Duffy, E., Evaluative attitudes as related to vocational interests and academic achievement. <u>J. abn. & soc. Psychol.</u>, 1940, <u>35</u>, 226-245.

The subjects were 108 freshmen entering Sarah Lawrence College. The Allport-Vernon Study of Values, the Strong Vocational Interest Blank for Women, and the ACE Psychological Examination were given to the subjects. The correlations among these variables and course grades are discussed and cases of curvilinearity are demonstrated. The factor analysis was performed using the 6 scores of the Allport-Vernon only. Orthogonal rotation.

Part I of the Allport-Vernon Study of Values presents a number of controversial statements or questions involving the concepts listed below. The subject indicates his personal preference with regard to the answer to these questions by checking one of the 2 alternatives offered. Two levels of intensity of preference are scored. Part II presents sets of 4 completions to controversial questions. The subject indicates the order of his preference among the 4 completions. From the answers indicated a score is determined for each of the values listed below. The nature of the test is such that a high score for one value can be obtained only when some other value, or values, receives a correspondingly low score.

- Du-1. Theoretical. Interest in the discovery of truth.
- Du-2. Economic. Interest in the useful.
- Du-3. Aesthetic. Interest in. form and harmony,
- Du-4. Social. Interest in and love of people.

I'. Philistine

- Du-5. Political. Interest in power.
- Du-6. Religious. Interest in a comprehension of, and unity with, the cosmos.

ANALYSIS Ey

Eysenck, H. J. Types of personality: a factorial study of seven hundred neurotics. J. ment. Sci., 1944, 90, 851-861.

The subjects were 700 male neurotic soldiers referred to Mill Hill Emergency Hospital for investigation and treatment, with organic illness cases not included. Correlations were Yule's coefficient of association based on dichotomized variables; they represent values about 30% larger than product-moment coefficients. Burt's Summation Method was used without rotation. See also Analysis CE.

In the list of variables below the numbers in parenthesis give the number of times the variable was noted in the group of 700.

- Ey- 1. Age above 30 vs. age below 30. (270)
- Ey- 2. Modal civil occupation: Unskilled and semiskilled vs. skilled, administrative, or professional. (538)
- Ey- 3. Little and much unemployment vs. no unemployment. (294)
- Ey- 4. Work history degraded, or unduly frequent changes of occupation vs. steady work history. (71)
- Ey- 5. Abnormality in parents or siblings (psychosis, epilepsy, mental deficiency, neurosis or psychopathic personality) present vs. absent. (275)
- Ey- 6. Home atmosphere during childhood and adolescence: unsatisfactory vs. satisfactory. (226)
- Ey- 7. Married vs. engaged, single, widowed, separated. (463)
- Ey- 8. Membership of political, social, cultural, industrial or other groups: nil vs. active or half-hearted. (574)
- Ey- 9. Hobbies and interests: narrow vs. broad. (550)
- Ey-10. Moderate or excessive alcohol vs. teetotal or abstemious. (377)
- Ey-11. Mental health before present illness: symptoms in childhood, symptoms and behavior in adult life indicating clear predisposition, or definite illness vs. normal. (488)
- Ey-12. Well-organized personality, adaptable, stable: No vs. Yes. (448)
- Ey-13. Weak, dependent, timorous personality: somewhat or very vs. not. (393)
- Ey-14. Drive and energy: inert, without initiative vs. average go or conspicuous energy. (505)

- Ey-15. Cyclothymic or consistently depressive or hypomanic: somewhat or very vs. not. (265)
- Ey-16. Schizoid, seclusive: somewhat or very vs. not. (235)
- Ey-17. Hypochondriacal personality: somewhat or very vs. not. (220)
- Ey-18. "Obsessional," meticulous: somewhat or very vs. not. (123)
- Ey-19. Somatic anxiety (palpitations, dyspnoea, precordial discomfort, sweating, flushing, diarrhoea): Yes vs. no. (386)
- Ey-20. Fatigue, lassitude, effort intolerance: Yes vs. no. (417)
- Ey-21. Dyspepsia, vomiting: Yes vs. no. (122)
- Ey-22. Fainting, fits: Yes vs. no. (101)
- Ey-23. Pain--not of demonstrable organic origin and excluding headache: Yes vs. no. (174)
- Ey-24. Tremor: Yes vs. no. (183)
- Ey-25. Sexual anomalies (impotence, ejac. praecox, masturbation worries, homo-sexuality, others): Yes vs. no. (89)
- Ey-26. Irritability: Yes vs. no. (164)
- Ey-27. Apathy, retardation: Yes vs. no. (97)
- Ey-28. Hysterical attitude to symptoms: Yes vs. no. (228)
- Ey-29. Muscular tone and posture: Poor vs. good or average. (92)
- Ey-30. Headaches: Mild or severe vs. none. (413)
- Ey-31. Anxiety, anxiety dreams, battle dreams: moderate or severe vs. none or mild. (352)
- Ey-32. Depression: moderate or severe vs. none or mild. (229)
- Ey-33. Hypochondriacal symptoms: mild, moderate or severe vs. r.one. (244)
- Ey-34. Hysterical conversion symptoms (motor, sensory, special senses, visceral or other): Any vs. none. (215)
- Ey-35. Stress of bombardment or exposure among chief psychological causes of illness: Yes vs. no. (137)
- Ey-36. Stress of wartime separation and regimentation among chief psychological causes of illness: Yes vs. no. (469)

Ey

- Ey-37. Stress of domestic problems among chief prychological causes of illness: Yes vs. no. (202)
- Ey-38. Intelligence: Below average vs. average or above. (183)
- Ey-39. Boarded out of the army vs. returned fit for duty. (171)

LOADINGS ON UNROTATED ORTHOGONAL FACTORS

- I. Neuroticism, instability, or lack of integration.
- II. Introversion, desurgency, or inhibition: hysterical vs. affective.
- III. Hypochondriasis or neurasthenia: Preoccupation with health of the body vs. more psychological type.
- IV. Social misfit vs. psychological conflict.

ANALYSIS Fe

Ferguson, L. W. Primary Social Attitudes. J. Psychol., 1939, 8, 217-223.

The subjects were 185 Stanford University students. They were given two forms of the Thurstone attitude scales (see Analysis Ch) on attitudes toward censorship, law, patriotism, and communism in addition to the six scales named in the table. The correlation coefficients used in a preliminary analysis were the averages of the tetrads relating the two forms of the scales to one another. Since simple structure could not be obtained in the rotation of factors, the four scales mentioned above were dropped, the 2 forms were used as separate variables, and orthogonal rotation then produced the tight structure as indicated.

ANALYSIS FK

Freeman, G. L., and Katzoff, E. T. Individual differences in physiological reactions to stimulation and their relation to other measures of emotionality. J. exp. Psychol., 1942, 31, 527-537.

The subjects were 24 college men. For each variable the subjects were ranked, and intercorrelations were computed by the rank-difference method.

- FK-1. Basal conductance variability. This was the range of skin conductance at rest for the several experimental sessions.
- FK-2. Average conductance recovery quotient startle. Where A is basal conductance level, B is the level near the high point one minute after stimulation, and C is the recovery level 5 minutes after stimulation, the formula for this variable is (B C)/(B A). Stimulation was a .22 blank fired outside line of vision and without warning. The situation was repeated for each subject after 1 to 30 days.
- Average conductance recovery quotient motor. Same formula as above. The subject was instructed to push "right" or "left" keys with the index finger as signaled by a "right" or "left" stimulus light. Wrong or delayed responses were punished by electric shock delivered through the reaction key. The series began with five trials in which either the right or left light was flashed; then followed 20 trials of which 10 (in random order) were conflict situations, i.e., both lights flashed simultaneously with shock punishment for all possible reactions. Finally, 5 more trials were given in which no double (conflict) stimulation was given. The entire test took 7 minutes. Reaction time was recorded throughout. The mituation was repeated for each subject after 1 to 30 days.
- Average conductance recovery quotient verbal. Same formula as above. After the subject was relaxed to the "basal" state, instructions calculated to reinforce existing personal conflicts were read. The subject then responded to a series of stimulus words, some of which were non-critical (such as "chair"), and some of which were critical (such as "masturbation"). The critical words were those on which blocking by an acquired inhibition or restraint might reasonably be expected. The entire test, including the reading of instructions, took 18 minutes. The situation was repeated for each subject after 1 to 30 days.
- FK- 5. Average conductance recovery quotient distraction. Same formula as above. The subject was instructed to make a series of pitch discriminations. The test began with 10 easily discriminable pairs of tones, passed to discriminations of increasing difficulty, and then returned to the first 10 "easy" discrimination pairs for a recheck. During the 40 interpolated pairs of stimuli, discriminations were made more difficult by introducing a distraction (intermittent ringing of telephone bell). The test took 7 minutes. The situation was repeated for each subject after 1 to 30 days.

- FK-6. Per cent conductance increment startle. The formula was (B A)/A. (See No. 2.) Stimulus as in No. 2. Stimulus repeated after 1-30 days.
- FK-7. Per cent conductance increment motor. As above for "motor."
- FK- 8. Per cent conductance increment verbal. As above for "verbal."
- FK- 9. Per cent conductance increment distraction. As above for "distraction."
- FK-10. Mean basal conductance. Since each subject rested until his palmar conductance became stable, it was possible to compute a mean level at which the stabilization occurred in each subject. This measure was taken as an index of the general level of physiological activity.
- FK-11. Basal movement variability. The subjects lay on a pneumatic mattress, by means of which gross (restless) movements were recorded mechanically. This variable was derived by taking the range for the several experimental sessions of the subjects' mean basal (resting) movement scores (No.16).
- FK-12. Movement increment startle. This was the amount of movement which followed the stimulus expressed as a percentage increment over the basal or resting amount of movement. Stimulus as in No. 2, repeated after 1-30 days.
- FK-13. Movement increment motor. As above for "motor."
- FK-14. Movement increment verbal. As above for "verbal."
- FK-15. Movement increment distraction. As above for "distraction."
- FK-16. Mean basal movement. Mean amount of movement during resting periods in the various experimental sessions.
- FK-17. Psychiatric rating. This was the average ranking for emotional stability by Dr. Leon Saul of the Institute of Psychoanalysis and the senior author.
- FK-18. Reaction time verbal. Average reaction time in the "verbal" situation in No. 4.
- FK-19. Voice level recovery quotient verbal. In the "verbal" situation, let the level of volume of voice while responding to the first non-critical words be A, let the level for the critical words be B, and for the final non-critical words be C. The formula for this variable was (B C)/(B A).

- FK-20. Voice level change verbal. Due to the fact that the voice level was frequently lowered to the point of a whisper in the case of critical words, there was no reason to compute voice level increment. Consequently, voice level change in either direction from a pre-test "basal" was the measure employed.
- FK-21. Reaction time recovery quotient verbal. Reaction times for precritical, critical, and post-critical associations were recorded in the verbal test. The average of pre-critical reaction times supplied a "basal" analogous to point A in the galvanic response curve. Similarly, critical reaction time averages yielded a B point, and post-critical reaction time averages a C point. The formula, then, was (B C)/(B A).
- FK-22. Behavior rating. The subjects rated themselves on a 5-point continuum on each of 18 behavioral aspects of "emotionality," such as: "Are you emotionally calm or excitable?"
- FK-23. Reaction time recovery quotient motor. Same as No. 21 for "motor."
- FK-24. Time sample of nervous movements.
- FK-25. General neuroticism questions. Questions were selected from Guilford's and Thurstone's Personality schedules and the Northwestern E-I test.
- FK-26. Anxiety questions. Selected as in No. 25.
- FK-27. General drive questions, Selected as in No. 25.
- FK-28. Inhibitory control questions. Selected as in No. 25.
- FK-29. Visceral disturbance questions. Selected as in No. 25.
- FK-30. Variability questions. Selected as in No. 25.

ANALYSIS Fn

Flanagan, J. C. Factor analysis in the study of personality. Stanford University: Stanford University Press, 1935, pp. 103.

The subjects were 305 eleventh-grade boys. Analysis was done by the Method of Principal Components yielding 2 orthogonal factors from the 4 variables. No rotation was made, but rotation was not called for.

The variables were the 4 scales of the Bernreuter Personality Inventory, a 125-item, Yes-?-No questionnaire. The scores were obtained by summing the weights assigned to the responses selected by the subject. Weights are assigned to each of the 3 alternative responses for each item. Sample items given below are those with the largest weight differentials between "Yes" and "No." The weights for "Yes" and "No", respectively, are given in parentheses.

- -Fn-1. Bl Neurotic Tendency
 - (7, -7) Do you often feel just miserable?
 - (7, -7) Are your feelings easily hurt?
 - (7, -7) Does some particularly useless thought keep coming into your mind to bother you?
 - (7, -7) Do your feelings alternate between happiness and sadness without apparent reason?
- Fn-2. B2 Self Sufficiency
 - (7, -7) Do you usually enjoy spending an evening alone?
 - (6, -6) Do you prefer making hurried decisions alone?
 - (6, -5) Do you think you could become so absorbed in creative work that you would not notice a lack of intimate friends?
- Fn-3. B3 Introversion-Extroversion-
 - (6, -7) Are your feelings easily hurt?
 - (5, -4) Do you experience many pleasant or unpleasant moods?
- Fn-4. B4 Dominance
 - (-4, 6) Are you troubled with shyness?
 - (-5, 5) Do you have difficulty in starting a conversation with a stranger?

ANALYSIS FT

Ford, C. F., and Tyler, L E. A factor analysis of Terman and Miles' M-F test. J. app. Psychol., 1952, 36, 251-253.

The subjects were minth grade students attending junior high schools in Eugene, Oregon. A separate analysis was made for 157 boys and 153 girls. The variables are derived from the Terman and Miles Attitude-Interest Analysis Blank. Scores were grouped into 14 subscores rather than the 7 indicated on the blank. Reliabilities were computed but not reported in the article. The subscores called Ink Blot Identification and Opinions were omitted because of low reliability and poor power to discriminate between boys and girls. All 14 are described below for completeness. Items are keyed + for masculine, - for feminine. The rotated loadings are reported only to one decimal place.

1. Word Association. Check word that goes best or naturally with given word.

Ex: Pole barber (0) cat (+) north (-) telephone (+) 60 items.

(Not used). Ink Blots. Check one of four names for a given ink blot. 18 items.

- 2. <u>Information</u>. Sentence completion covering a variety of fields, 3 or 4 choices. 70 items.
- 3. Anger. Check whether 17 items for you cause very much, much, little, or no anger.

 Ex: Being blamed for something you have not done. -VM, OM, +L, ON.
- 4. Fear. Check whether 20 items for you cause very much, much, little, or no fear.

 Ex: Being lost. -VM, -M, +L, +N.
- 5. Disgust. Check whether 18 items for you cause very much, much, little, or no disgust.
 Ex: An unshaven man. -VM, -M, +L, +N.
- 6. Pity. Check whether 15 items for you arouse very much, much, little, or no pity.

 Ex: A dog that must be killed for biting people. -VM, OM, +L, +N.
- 7. Ethical Attitudes. Check whether you feel 23 items are 3. extremely wicked, 2. decidedly bad, 1. somewhat bad, or 0. not really bad.

 Ex: Picking flowers in a public park. 03, -2, +1, +0.
- 8. <u>Interests</u>. Check 71 occupations, people, and activities as to <u>like</u>, <u>dislike</u>, or <u>neither</u>.
- 9. Books. Check 23 books as to like, dislike, or neither.
- 10. Activity Preference. Check 8 subjects for art, 6 news events, 11 trips as to like, dislike, or neither.

- 11. Famous People. Check 28 names as to like, dislike, or neither.
- (Not used) Opinions. Check 14 opinions or variety of subjects true or false. Ex: The fact thous how intelligent a person is. -T, +F.
- 12. Introvertive Response. Answer 42 personality questions <u>yes</u> or <u>no</u>.

 Ex: Do you like most people you know? +Yes, O No.

ANALYSIS Gi

Gibb, C. A. Personality traits by factorial analysis (II). Aust. J. Psychol. Phil., 1942, 20, 86-110.

The subjects were a total of 117 men and 83 women in their first two years in Psychology and Social Science classes at the University of Sidney. The analysis used partial tetrachoric correlations which held constant the influence of age. A first analysis used the 4 Bernreuter scales in addition to the variables listed below, but the results were considered to suffer from very high correlations between overlapping variables and were not fully reported.

Gi- 1. Allport A-S Reaction Study. This is a questionnaire presenting 41 items, social or everyday situations. The subject is given 2 to 4 alternative responses to indicate his "usual reaction." A high score represents ascendance, a low score submissiveness.

Sample item: Do you feel self-conscious in the presence of superiors in the academic or business world?

Marl	ked.	Ly	
Some	ewha	at _	
Not	at	all	

Gi- 2. Personal Inventory. This was 42 items selected from Thurstone's Personality Schedule, a questionnaire inventory of 223 Yes-No items. The 42 items, covering sociability, self-consciousness and emotionality, constitute the variables of a factor analysis by Gibb not reported here. See Supplementary Analysis List.

Variables 3 and 4 are scales for the Bernreuter Personality Inventory (see Analysis F1). Sample items given below are those with the largest weight differentials between "Yes" and "No". The weights for "Yes" and "No", respectively, are given in parentheses.

- Gi- 3. Flanagan Fl-C Scale: Self-Consciousness.
 - (8, -5) Are you troubled with shyness?
 - (6, -6) Do you often find that you cannot make up your mind until the time for action has passed?
 - (8, -4) Do you have difficulty in starting a conversation with a stranger?
- Gi- 4. Flanagan F2-S Scale: Solitariness.
 - (6, -7) Have books been more entertaining to you than companions?
 - (8, -4) Do you think you could become so absorbed in creative work that you would not notice a lack of intimate friends?
- Gi- 5. Otis Self Administering Test of General Ability Mainly a test of verbal ability.

Gi

Variables 6 through 9 were selected subtests of the Australian Institute of Industrial Psychology Clerical Test.

- Gi- 6. Digit Symbol Substitution.
- Gi- 7. Spelling Correction.
- Gi- 8-17. See table of loadings below.

ANALYSIS GWA

Guilford, J. P., and Guilford, R. B. Personality factors S, E, M, and their measurement. J. Psychol., 1936, 2, 109-127.

The subjects were 930 students. Tetrachoric correlations were used. The factors seemed to be best described as orthogonal, and so orthogonal rotation was used.

- GuA- 1. Do you express yourself better in speech than in writing?
- GuA-2. Are you inclined to limit your acquaintances to a select few?
- GuA- 3. Do you generally prefer to take the lead in group activities?
- GuA- 4. Do you prefer to read about a thing rather than experience it?
- GuA-5. Do you like work which requires considerable attention to details?
- GuA- 6. Are you generally very particular about your dress and personal property?
- GuA 7. Are you inclined to be considerate of other people's feelings?
- GuA- 8. Are you inclined to act on the spur of the moment without thinking things over?
- GuA-9. Have you ever kept a personal diary of your own accord?
- GuA-10. Do you work much better when you are praised?
- GuA-11. Do you like to change from one type of work to another frequently?
- GuA-12. Are you inclined to study the motives of others?
- GuA-13. Do you daydream frequently?
- GuA-la. Do you prefer to work with others rather than alone?
- GuA-15. Are you inclined to worry over possible misfortunes?
- GuA-16. Are you frequently somewhat absent minded?
- GuA-17. Do you like to persuade others to your point of view?
- GuA-18. Are you inclined to keep in the background on social occasions?
- GuA-19. Are you more interested in athletics than in intellectual things?
- GuA-20. Do you usually dislike to change opinions you have already formed?
- GuA-21. Do you like to speak in public?

GuA

- GuA-22. Do you prefer to work things out on your own hook rather than accept suggestions from others?
- GuA-23. Do you have frequent ups and downs in mood, either with or without apparent cause?
- GuA-24. Are you inclined to be slow and deliberate in movement?
- GuA-25. Are your feelings rather easily hurt?
- GuA-26. Do you enjoy getting acquainted with most people?
- GuA-27. Are you inclined to keep quiet when out in company?
- GuA-28. Do you adapt yourself easily to new conditions?
- GuA-29. Do you like to confide in others?
- GuA-30. Do you express such emotions as delight, sorrow, anger, etc., readily?
- GuA-31. Are you inclined to think about yourself much of the time?
- GuA-32. Do you like to have people watch you when you are working?
- GuA-33. Do you frequently rewrite social letters before mailing them?
- GuA-34. Do you like to sell things?
- GuA-35. Do you get rattled easily in exciting situations?
- GuA-36. Are you a male?

LOADINGS ON ORTHOGONAL FACTORS

- I. S (social introversion-extroversion, sociability, or shyness)
- II. E (emotional immaturity, lack of self-sufficiency or of cortical control over the emotional centers)
- III. M (masculinity-femininity, aggressiveness, ascendance, submission)
- IV. R (carefree, careless, impulsive)?
- V. T (thinking introversion, intellectual leadership, liking thinking)?

ANALYSIS GuB

Guilford, J. P. and Guilford, R. B. Personality factors, D, R, T, and A. J. abn. and soc. Psychol., 1939, 34, 21-36.

The subjects were 610 men and 390 women from classes in elementary psychology where the questionnaire was introduced as a class demonstration. "As an extra inducement, they were told that they might know their scores on two traits, 'rhathymia' and 'thinking introversion'."

The battery of questions was set up to test the previously obtained factors of rhathymia and thinking introversion. The questionnaire, therefore, emphasized the happy-go-lucky (rhathymic) characteristics of people, the hypothetical thinking dimensions, and their opposites. Some seclusiveness items were also included. Altogether 89 items were prepared; 30 of these were used in the analysis. Two other items had been correlated with the 30, but were eliminated because of their very low correlations.

Three possible responses were permitted for each item: "Yes,"
"?," or "No." In every case the responses were reduced to 2 categories
by combining the "?" with "Yes" or "No," whichever made the more even
two-fold division. Tetrachoric correlations were used. The table of
loadings given in the article is based on orthogonal rotation, although
the authors explain that there would be some advantages in a rotation
such that Factor I correlated .67 with Factor VI and .48 with Factor IV,
which Factor VI also correlated .53 with Factor IV. Another rotational
solution for these same data is given in Analysis RTC.

- GuB- 1. Are you ordinarily a carefree individual?
- GuB- 2. Do you usually have difficulty in starting a conversation with strangers?
- GuB- 3. Do you prefer to read about a thing rather than to experience it?
- GuB- 4. Do you hesitate to lend your personal property even to close friends?
- GuB- 5. Are you inclined to be considerate of other people's feelings?
- GuB- 6. Are you relatively unconcerned about what others think of your actions?
- GuB-7. Are you inclined to analyze the motives of others?
- GuB-8. Do you consider yourself a practical individual rather than one who theorizes?
- GuB- 9. Do you usually keep in close touch with things going on around you?
- GuB-10. Are you inclined to worry over possible misfortunes?
- GuB-11. Do you often have the "blues"?
- GuB-12. Are you inclined to keep in the background on social occasions?

GuB

- GuB-13. Are you more interested in athletics than in intellectual things?
- GuB-14. Would you rate yourself as an impulsive individual?
- GuB-15. Do you enjoy getting acquainted with most people?
- GuB-16. Do you frequently find yourself in a meditative state?
- GuB-17. Are you inclined to be over-conscientious?
- GuB-18. Do you often crave excitement?
- GuB-19. Are you inclined to ponder over your past?
- GuB-20. Are you inclined to stop and think things over before acting?
- GuB-21. Are you less attentive than most individuals to things going on around you?
- GuB-22. Do you like to discuss the more serious questions of life with your friends?
- GuB-23. Do you like to try your wits in solving puzzles?
- GuB-24. Would you rate yourself as a happy-go-lucky individual?
- GuB-25. Do you enjoy thinking out complicated problems?
- GuB-26. Are you inclined to be introspective, that is, to analyze yourself?
- GuB-27. Are you usually unconcerned about the future?
- GuB-28. Do you usurally become so absorbed in watching an athletic contest that you completely forget yourself?
- GuB-29. Can you relax yourself easily when sitting or lying down?
- GuB-30. Are you more alert to your immediate surroundings than the average person?

LOADINGS ON ORTHOGONAL FACTORS

- I. Depression, D. Depression with a strong aspect of thinking of a meditative sort.
- II. Rhathymia, R. Freedom from care, lack of serious-mindedness, impulsiveness. Not the opposite of Depression.
- III. Liking for Thinking, LT. A liking for rather than indulgence in thinking.
- IV. Shyness or Seclusiveness, S.
- V. Not named. Perhaps concerns a cool, positive, person who lives in the present.
- VI. Thinking, T. This may be "Thinking Introversion" but is not clear.
- VII. Alertness, A.

VIII and IX. No interpretation.

ANALYSIS GuC

Guilford, J. P. and Guilford, R. B. Personality factors N and GD. J. abn. & soc. Psychol., 1939, 34, 239-248.

The subjects were 600 students in elementary psychology at Northwestern University and the University of Nebraska. This was introduced as a class demonstration of personality questionnaires. As an added inducement for a truthful expression of their own characteristics as they knew them, the students were told that they might be given later a score for hyperactivity.

A battery of 100 questionnaire items was collected consisting of questions about an individual's characteristic manner of reacting on a hyperactivity-hypoactivity continuum, but also including other items known to contain loadings with already discovered factors. The purpose of the additional kinds of items was partly to help disguise the real nature of the inventory and partly to check previous factor analyses and perhaps to find new items loaded with old factors. This analysis deals with 24 "of the most representative of these items." One item was omitted from the analysis because its maximum coefficient of correlation was only .14.

Three possible responses were permitted for each item: "Yes," "?," or "No." In every case the responses were reduced to 2 categories by combining the "?" with "Yes" or "No," whichever made the more even two-fold division. Tetrachoric correlations were used. Another factorial solution for these same data is given in Analysis RTD.

- GuC-1. In a difficult or exacting situation have you often found yourself perspiring?
- GuC-2. Do you feel compelled to change your bodily position or posture frequently while sitting?
- GuC- 3. Do you like to change from one type of work to another frequently?
- GuC-4. Are you easily disturbed by distrecting stimuli while doing mental work?
- GuC-5. Are you inclined to be slow and deliberate in movement?
- GuC- 6. Do you express such emotions as delight, sorrow, anger, and the like readily?
- GuC- 7. Are you easily startled by unexpected stimuli?
- GuC-8. Are you inclined to stop and think things over first before acting?
- GuC- 9. Do you have any "nervous habits" like chewing your pencil or biting your finger nails?
- GuC-10. Does it annoy you to see a person clean his finger nails in public?
- GuC-11. Do you usually eat more rapidly than the average person even though you have plenty of time?

GuC

- GuC-12. Are you inclined to rush from one activity to another without pausing for rest?
- GuC-13. Would you like a position in which you changed from one kind of task to another frequently during the day?
- GuC-14. While listening to a lecture, does your hand keep active in writing or drawing when not taking notes?
- GuC-15. Would you rate yourself as a happy-go-lucky individual?
- GuC-16. Do you frequently suffer from insomnia?
- GuC-17. Do you often find yourself hurrying to get places even when there is time?
- GuC-18. Are you inclined to be quick in your actions?
- GuC-19. Do you think you use up more energy than most individuals in getting things done?
- GuC-20. Can you turn out a large amount of work in a short time?
- GuC-21. Can you relax yourself easily when sitting or lying down?
- GuC-22. Would you rate yourself as a talkative individual?
- Gut-23. Do you dislike very much to be interrupted in a task that you want to finish?

ANALYSIS HJ

Hart, H. H., Jenkins, R. L., Axelrod, S., and Sperling, P. I. Multiple factor analysis of traits of delinquent boys. J. soc. Psychol., 1943, 17, 191-201.

The subjects were 300 boys committed to the New York State Training School for Boys. Nearly all were between 12 and 15 years old; 42% were white, 58% colored. Cases were selected who had a relatively complete case history. Symptoms and types of behavior were mentioned or not mentioned in the records by social workers and psychiatrists. Tetrachoric correlations were used. Analysis was carried out by a "directed" analysis similar to Thurstone's "grouping" method for the first factor. For the other factors analysis was by both this and by the centroid method. Cited here is the data for the centroid analysis where that was used. Rotation was orthogonal, as far as can be judged from the text, except that Temperassault and Ego-compensation were made to correlate "27° 57'".

ANALYSIS Ho

Howie, D. Aspects of personality in the classroom: a study of ratings on personal qualities for a group of schoolboys. Brit. J. Psychol., 1945, 36, 15-28.

The subjects were 156 Wiltshire schoolboys and 139 London schoolboys whose average age was about 13 years. The factor analysis was carried out through the extraction of 4 factors by both the principal components and centroid method with nearly identical results. The correlation matrix was also subjected to partialling out of variance with grades and an analysis by Burt's simple summation method with rotation. Only the centroid results after orthogonal rotation are recorded here.

Variables 1-10 consist of teachers' ratings. Each rating was made separately during a week in which the teacher observed for that trait alone. The rating was done by sorting cards each one bearing a student's name. The cards were sorted first into 3 piles, x, y, and z, of 20%, 60%, and 20%. Then each of these piles were sorted into 25%, 50%, and 25%. The nine piles were reduced to seven normally distributed groups by combining the "below average" group for x with the "above average" group for y and the "below average" group for y with the "above average" group for z. Only 2 of the traits are described here by way of example; the rest are named in the table of loadings.

- Ho- 3. Common sense. Description on rating schedule: +3 Never at a loss in everyday affairs. -3 Confused and incompetent in everyday problems.
- Ho-10. Self consciousness. Description on rating schedule: +3, Easily embarrassed to an uncomfortable degree. Extreme bashfulness.

 -3, Perfect self-confidence, 'cheekiness'.

Variables 11-13 consist of "buddy" ratings.

- Ho-ll. Popularity. Each boy expressed his degree of liking for each other boy in the group on a 5-point scale.
- Ho-12. Tendency to show fear. Each boy was asked to write down the names of (a) 3 boys in his class who showed the quality in the most marked degree, and (b) 3 boys who showed the quality in the least marked degree. The score was the total number of times mentioned under (a) less the total number of times mentioned under (b).
- Ho-13. Tendency to show anger. Same rating system as for Ho-12.
- Ho-14. Ascendance-Submission. This was an adaptation of the Allport Ascendancy-Submission Scale.
- Ho-15. Examination. This was the score on an "examination at the end of the autumn term."
- Ho-16. Burt's Northumberland Scale for general intelligence. Verbal and non-verbal.

ANALYSIS Ko

- Koch, H. L. A factor analysis of some measures of the behavior of preschool children. J. gen. Psychol., 1942, 27, 257-287.
- Koch, H. L. An analysis of certain forms of so-called "nervous habits" in young children. J. genet. Psychol., 1935, 46, 139-170.

The subjects were 46 nursery school children, 21-58 months old, including 21 boys and 25 girls. They were from above average homes and probably had better than average adjustment and greater homogeneity than the whole population. The measures of behavior tendencies used were obtained by the short behavior sample method. Each child was observed for 400 half minutes, these scattered over eight months of time. No more than 2 half-minute samples of a child's behavior were usually observed in a day, and these at widely separated intervals. One hundred of these short samples were obtained for each child at the school during each of the following situations: The free play period outdoors, the free play period indoors, the period of directed activity or formal circle work (stories, music, rhythms, etc.), and the routines (washing, dressing, etc.). Two coservers trained for six weeks, until the better of the two recorded 85 to 100 per cent of the items reported by both. Then the better trained coserver worked alone, using a code for recording. This one observer, Miss Helen Streit, was solely responsible for making the records. The score used for each movement mannerism was the number of times the pattern was executed during 400 observation periods. Except for the variable Sex, product-moment correlations were used. Oblique rotation.

Most of the variables are adequately described by the name appearing in the table of loadings. Others calling for additional description are as follows:

- Ko-10. Corporal limited. This was a catch-all for movement patterns presumably functionally similar to those placed in the other classifications but not appropriately referable to these latter because of the body part manipulated. If the child rubbed his stomach or stroked his knee, for instance, these behaviors were referred to this omnibus category.
- Ko-15. Acting silly. Acting silly or swaggering in a way that did not employ verbal or vocal activity.
- Ko-16. Attention seeking. Indulging in noisy, exaggerated behavior such as laughing loudly or screeching.
- Ko-21. Non-participation. Refusing to participate in the formal group work directed by the teacher.
- Ko-22. Comply. Complying with the requests of adults or children.
- Ko-27. Indirect attack. This was snatching or destroying another's possessions when the latter was not present, doing what was forbidden when the teacher turned her back, etc.
- Ko-30. Flit. This was changing the focus of activity in a rather major way at least 3 times in a half minute.

- Ko-31. Persistence. Persisting at a task in the face of obvious difficulty.
- Ko-32 and 33. Resistance level. Skin resistance level was observed on 2 parallel occasions separated by about 4 weeks. The child was seated in a high chair with an electrode on the sole of one foot and on the corresponding calf. A series of pleasant, unpleasant, and startling stimuli were presented at intervals of 30 seconds. The cores were averages of the readings taken in 1000-ohm units.
- Ko-34. Resistance decrease. This was the average relative decrease for all stimulation at both sessions.
- Ko-35. Resistance recovery. This was the average relative recovery in resistance after 3 seconds.
- Ko-36. Constipation Index. This was a rough measure which took into account the frequency of bowel movements, consistency of faeces, and use of laxatives.

ANALYSIS Kr

Kremer, A. H. The nature of persistence. Stud. Psychol. Psychiat., Cathol. U. Amer., 1942, 5, No. 8. Pp.40.

The subjects were 156 boys, 8 to 15 years old, in grades 4 through 7.

- Kr-1. Inkblot I. This test was individually administered. Cards No. 1, 2, 7, 12, and 16 of the Whipple Imagination Cards were given to the subject. Standard directions asking the children to tell what they saw in each blot were used. The time spent on the entire series of cards was taken as the score.
- Kr- 2. Inkblot II. For the purpose of making the instructions more clear the test was repeated at a later session with cards 6, 9, and 11. This time the subject was shown No. 16 and was asked to point out the teapot, the hand, and the face. If he failed to see these images, they were pointed out to him. Then he was given the new series of cards and told to point out the things he could find on them. The scoring was done as before.
- Kr-3. Puzzle Mastery. This was administered to groups of 5 subjects seated around a table. A model of a 3-dimensional cross made up of 9 pieces of wood was placed on the center of the table.

 Directions: Now we will do a puzzle. To solve this puzzle you must take the pieces and put them together to make a cross like this one (pointing to the model on the table before them). When you get tired of this and want to quit, bring it up to me, and I will let you try some of the other puzzles I have on that table.

The time spent on the first puzzle only was noted as a measure of persistence. Only 2 subjects succeeded in solving the puzzle.

- Kr- 4. Word Building. The subjects were required to make as many words as they could out of the series of letters, EATRDN, LAECKB, and OREMBUNO. They were told that they may hand in their paper when they were through, but to be sure first that there were no more words to get. The score was the time spent working.
- Kr-5. Coding. The coding test was given on another day. This test required the transfer of a lengthy passage into a simple code. Here again, after the directions had been read, the code to be used was explained with demonstrations on the blackboard. Ten minutes after the starting signal was given, the children were again reminded that they need not finish the entire passage. As this was the last paperpencil test to be administered to the group, the children were told that they might go out to the playground when they turned in their papers. Despite this strong motivation to stop, several subjects spent over an hour at the task until they had finished the entire passage. The score was the time spent working.
- Kr-6. Magic Squares. An example of a 9-cell magic square (where numbers in every row, column, and diagonal add up to the same number) was given on the test paper. The subject was directed to make a similar square, with 4 cells in each direction. After an interval of 10 minutes the subjects were reminded that they were permitted to quit any time they wished and work on their own work. The score was the time spent on the magic square,

Kr

Variables 7-23 were ratings of personality traits on a 7-point scale. At' least 2, and where possible 3, raters, who were well acquainted with the subjects, were obtained for each class. In the instructions accompanying the rating scale the raters were cautioned to avoid the halo effect. As a further precaution, the scale was so constructed that the entire class was rated simultaneously on one item at a time. The mean of the 2 or 3 ratings was taken as an individual's score on the item.

- Kr- 7. Does he keep at a hard task until he succeeds in accomplishing it?
- Kr-8. Does he keep his attention on his lessons in spite of distractions?
- Kr- 9. Does he do what everybody else is doing just because they are doing it?
- Kr-10. Does he keep his promises?
- Kr-11. Can he be trusted to perform errands satisfactorily?
- Kr-12. Can he be relied upon to do chores around the school or in the classroom?
- Kr-13. Does he get surly when punished?
- Kr-14. Does he tend to daydream?
- Kr-15. Is he obedient?
- Kr-16. Is he shy, bashful, and retiring or nervous in the presence of others?
- Kr-17. Does he take the part of a leader or organizer on the playground?
- Kr-18. Is he easily led by others?
- Kr-19. Is he truthful?
- Kr-20. Is he boisterous and active?
- Kr-21. Does he mix in readily with other boys in play?
- Kr.22. Does he get along well with his companions?
- Kr-23. Does he like to boast, brag, or impress others?
- Kr-24. Mental Age. Intelligence scores on the Philadelphia Mental Ability Test.
- Kr-25. General Average. Average of marks, mostly term examinations, in English, Reading, Spelling, History, Geography, and Arithmetic.

 $[\]underline{\underline{Pe}}$ seems to be combined here with elements of $\underline{\underline{De}}$ and $\underline{\underline{So}}$.

 $^{^2}$ There is some $\underline{\text{Pe}}$ here. This factor seems not to be rotated with factor 1 for simple structure or for best psychological meaning.

ANALYSIS La

Iayman, E. M. An item analysis of the adjustment questionnaire.
J. Psychol., 1940, 10, 87-106.

The experimental group consisted of 276 freshman men enrolled at the University of Iowa.

The Personality Schedule used in the analysis consisted of 51 items selected from 782 items from 16 different personality questionnaires. The selection process included: 1. Weeding out items failing to meet statistical and logical requirements of validity, objectivity, and reliability, and those items dealing with factors other than behavior patterns. The data of other experimenters was used in this process. 2. The remaining 170 items were sorted by judges into piles representing 16 personality traits. The judges rated the diagnostic value of each item for these traits and recommended rejections. 3. The remaining 97 items were used in a preliminary schedule which dropped or combined the original 16 traits to produce 10 criterion groups of items. These included items supposedly measuring sociability, self-sufficiency, feeling of social inadequacy, emotional instability, impulsiveness, egocentricity, and self-consciousness. 4. This preliminary schedule was given to the experimental group and biserial correlations were made between each test item and each of the 10 criterion groups. All items having no biserials above .39 or more than 10% "?" responses were eliminated. 5. A separate factor analysis was made for the items in each of the 9 criterion groups. The other one, self-consciousness, was omitted, since all of the items included in this group were found in other groups. After rotation of these factor matrices all items having loadings of .50 or more for one or more factors were combined in the final matrix. This included 51 items. Tetrachoric correlations were used.

The reliabilities noted with the items are those obtained for 40 graduate students who took the test twice with an interval of 3 weeks.

- La-1. Have you preferred being alone most of the time? $R_t = 62$.
- Ia-2. Do you feel that people are secretly talking about you? $R_t = 97$.
- La- 3. Do you usually plan out your work carefully before you begin it? $R_{\rm t} = 94$.
- La- 4. Do you often say things on the spur of the moment and then regret them? $R_{\pm} = 70$.
- La-5. Does it bother you to have people watch you at work even when you do it well? $B_t = 89$.
- La-6. Do you tend to be slow and deliberate in your movements? $R_t = 88$.
- La-7. Are you troubled with the idea that people on the street are watching you? $R_{\pm} = 81$.
- La-8. Are you inclined to be suspicious of the motives of others? $R_t = 82$.

161

- La- 9. Do you usually understand a problem better by studying it out alone than by discussing it with others? $R_+ = 40$.
- La-10. Do you make new friends easily? $R_{+} = 51$.
- La-11. Are you inclined to keep quiet when out in a social group? $R_t = 38$.
- La-12. Do you care much for parties or dances? $R_t = 88$.
- La-13. Do you usually enjoy spending an evening alone? $R_t = 64$.
- La-14. Do you prefer to work things out in your own way rather than to accept suggestions from others? $R_{\pm} = 16$.
- La-15. Do you enjoy being in a crowd just to be with people? $R_t = 64$.
- La-16. Do you enjoy taking part in many social affairs? $R_t = 36$.
- La-17. Are you greatly embarrassed if you have greeted a stranger whom you have taken for an acquaintance? $R_t = 41$.
- La-18. Do you usually prefer to do your own planning alone rather than with others? $R_{\pm} = 32$.
- La-19. Are you inclined to limit your acquaintances to a select few? $R_{t} = 87$.
- La-20. Do you often have difficulty in thinking of an appropriate remark to make in group conversation? $R_{t} = 70$.
- La-21. Do you like to be by yourself a great deal? $R_t = 84$.
- La-22. Do you feel embarrassed when you have to enter a public assembly after everyone else has been seated? $R_t = 48$.
- La-23. Do you enjoy getting acquainted with most people? $R_{\rm t}$ = 48.
- La-24. Do you like to be with other people a great deal? $R_{\rm t}$ = 43.
- La-25. Do you have difficulty in starting conversation with a stranger? $R_{\rm t}$ = 80.
- La-26. Do you have frequent ups and downs in mcod either with or without apparent reason? $R_{t} = 67$.
- La-27. Have you, in the past five years, been active in organizing any clubs, teams, or other such groups? $R_{\pm} = 84$.
- La-28. Are you easily moved to tears? $R_t = 84$.
- La-29. Do you ever try to argue or bluff your way past a guard or doorman? $R_{\rm t}$ = 19.
- La-30. Do you frequently have spells of the "blues" for no good reason: $R_t = 81$.

- La-31. Do you ever upbraid a workman who fails to have your work done on time? $R_{t} = 59$.
- La-32. Are you often in a state of excitement? $R_{+} = 75$.
- La-33. Do you get "rattled" easily in exciting situations, or at critical moments? $R_+ = 39$.
- La-34. Do you often feel "just miserable" for no reason at all? $R_{t} = 61$.
- La-35. Do you ever "heckle" a public speaker? $R_{t} = 61$.
- La-36. Do you experience many pleasant or unpleasant moods? $R_{+} = 58$.
- La-37. Do you consider youself less emotional than the average person, that is, less easily upset? $R_{+} = 67$.
- La-38. Are you inclined to keep in the background on social occasions? $R_{+} = 20$.
- La-39. Do your interests change rapidly? $R_{+} = 83$.
- La-40. Do you hesitate to put your abilities to the test? $R_{t} = 30$.
- La-41. Does it bother you to have an unfinished job on your hands? $R_t = 30$.
- La-42. Do you feel self-conscious in the presence of superiors? $R_{\rm t} = 70$.
- La-43. Do you tend to day-dream instead of doing your work? $R_t = 68$.
- La-44. Are you easily discouraged when the opinions of others differ from your own? $R_{t} = 74$.
- La-45. Does it make you uncomfortable to be "different" or unconventional? $R_t = 23$.
- La-46. Do you feel self-conscious in front of strangers or a large crowd? $R_{+} = 34$.
- La-47. Do you work by fits and starts? $R_t = 94$.
- La-48. Does it bother you a great deal to know that people are saying disparaging things about you? $R_t = 85$.
- La-49. Are you, in general, self-confident about your abilities? $R_t = 83$.
- La-50. Do you prefer to work alone rather than with people? $R_{\pm} = 06$.
- La-51. Do you find it difficult to get rid of a salesman? $R_{t} = 92$.

ANALYSIS Lo

Lovell, C. A study of the factor structure of thirteen personality variables. Educ. psychol. Meas. 1945, 5, 335-350.

The subjects were 200 psychology students in 4 college classes: 122 men and 78 women between the ages of 18 and 32. Two sets of factors were extracted. The first used the largest correlation in a column as the diagonal entry. Since these were not found to be sufficiently close to the values of h² obtained, the obtained values of h² were used as diagonals in the second extraction reported here. Since the variables are already factor scores, the factors found in this analysis are considered to be super-factors.

The variables were the 13 measured by Guilford's <u>Inventory of Factors</u> S T D C R, the Guilford-Martin <u>Inventory of Factors G A M I N</u>, and the Guilford-Martin <u>Personnel Inventory I</u>. These are all self-. ventories of the yes-?-no type. The students were told that the results would not affect their course grades. In cases where the number of items with "yes" indicating a positive score is badly out of balance by the number of items with "no" indicating a positive score, these numbers are given.

- Lo- 1. S, Social Extraversion Introversion. Sociability, tendency to seek sccial contacts, to enjoy company of others vs. Shyness, seclusiveness, tendency to withdraw from social contacts. Sample items: Limits acquaintances to a select few, keeps quiet in social groups, difficulty in starting conversation with strangers, frequent loneliness, spends evenings alone, takes life seriously, bashfulness, lets others take the lead.
- Lo- 2. Thinking Extraversion! Introversion. Extravertive orientation in thinking vs. Inclination to meditative or reflective thinking, philosophizing, analyzing one's self and others.

 Sample items: Analyzes motives of others, ponders over the past, takes life seriously, works on complicated problems, often lost in thought, much attention to details, often moody, works better when praised.
- Lo- 3. D, Freedom from Depression. Cheerfulness and optimism vs. Habitually gloomy, pessimistic mood, feelings of guilt.

 Sample items: Often moody, self-conscious, daydreams frequently, often worries, frequent ups and downs in mood, feelings easily hurt, loneliness, difficulty in making decisions, feelings of inferiority, often excited.
- Lo- 4. C, Emotional Stability. Uniformity in mood, evenness of disposition vs. Strong emotional fluctuations, tendency toward flightiness, emotional instability. (68 yes, 5 no.)

 Sample items: Moody, acts on the spur of the moment, works better when praised, charges work frequently, daydreams, worries, ups and downs in mood, feelings easily hurt, impulsive, interests change quickly, lonely, high-strung, absent-minded.

- Lo- 5. R. Rhathymia. Happy-go-lucky, carefree disposition, lively, impulsive vs. inhibited, over-controlled, conscientious, seriousminded.

 Sample items: Carefree, acts on spur of the moment, impulsive, craves excitement, jumps at conclusions, lively, plays pranks on others, restless.
- Lo- 6. G. General activity. General pressure for vigorous activity.

 (21 yes, 3 no.)

 Sample items: Quick in actions, eats rapidly, walks fast, "on the go," starts work with enthusiasm, hurries, talkative, impulsive, daredevil, group leader.
- Lo- 7. A, Ascendance Submission. Social leadership.

 Sample items: Easily starts conversation with strangers, good at bluffing, organizer, takes social initiative, likes public speaking, takes responsibility, takes charge in case of accident, stands up for his rights, a good salesman.
- Lo-8. M, Masculinity Femininity. Positive: Masculinity in emotional and temperamental make-up.

 Sample items: Wants to be physically strong, not afraid of the dark, likes hunting, likes to take a chance, not afraid of deep water, not sorry for underdog, not afraid of snakes, preference for mathematics, science, politics, building trades, mining, prize fights, rather than literature, music, flowers, art, dancing.
- Lo- 9. I, Freedom from Inferiority feelings. Self-confidence and lack lack of inferiority feelings vs. lack of confidence, underevaluation of one's self, feelings of inadequacy.

 Sample items: Often feels thwarted, bossed around too much, often bored, slow emotional recovery from emotional upset, awkward, craves encouragement, absent-minded, unpopular, easily discouraged, slow in making decisions.
- Lo-10. N, Freedom from Nervousness. Calm, unruffled, relaxed vs. Jumpiness, jitteriness, easily distracted, irritated, easily annoyed. (5 yes, 38 no.)
- Lo-11. On Objectivity. Tendency to view one's self and surroundings objectively and dispassionately vs. tendency to take everything personally, hypersensitive, easily upset, nervous, disturbed by criticism, readily unburdens his troubles to others, easily offended, or annoyed. (2 yes, 45 no.)
- Lo-12. Ag, Agreeableness. Lack of quarrelsomeness and a lack of domineering qualities vs. beligerance, readiness to fight over trifles, does not like to take instructions from others, feels that most people are stupid, hates to lose an argument, dislikes many people, takes pleasure in bossing people, selfish, frequently in conflict, contempt for opinions of others, self-confident about his own abilities, "hard-boiled." (2 yes, 36 no.)

Lo-13. Co, Cooperativeness. Willingness to accept things and people as they are and a generally tolerant attitude vs. Lack of faith in people, believes most people shirk their duties, dislikes his superiors, against large business corporations, dislikes traffic regulations, distrustful of all successful people. (4 yes, 56 no.)

Since each variable covers a factorial area, these factors all tend to be combinations.

² These are the reliabilities published in the manuals.

ANALYSIS Lu

Lurie, W. A. A study of Spranger's value-types by the method of factor analysis. J. soc. Psychol., 1937, 8, 17-37.

The subjects were 203 white freshmen and sophomores at the University of Chicago. Almost all were either 18 or 19 years old. 128 were men; 75 were women. There were 79 Protestants, 55 Jews, 49 professing no religion, 18 Catholics, and 2 Greek Orthodox. The parents of the subjects were professional or business and white-collar workers in about equal proportions, with a scattering of artisans and laborers.

The test items included 24 for each of Spranger's 6 types. Among the 24 were 6 for interests, 6 for ideals, 6 for preferences in people, and 6 for beliefs. The material was similar to that used by Allport and Vernon (see Analysis Du). The subjects used a 7-point scale. A score of zero was assigned to every item marked by the subject in the "Complete Rejection" column, 1 for "Strong Disapproval," and so on, consecutively, to 6 for "Complete Acceptance." 24 scores were computed for each individual, a theoretical interests score being computed by adding the acceptance ratings on the 6 items of the theoretical type in the class of interests, a theoretical ideals score by adding scores for the 6 theoretical ideals items, and similarly for the 6 types of items in each of the 4 classes. Tetrachoric correlations were used.

Samples of the test items (not variables) and the key appear below. To the right of the items the test included 7 vertical columns for the subjects' check marks.

sub	jects' check marks.	Key
1.	Granting that you had the necessary ability and training, indicate how much you would like to teach each of these subjects:	i nt ere sts
	a. Modern Poetry b. Algebra c. Comparative Religions	A T R
3.	To what extent does each of the following possible ends of scientific research appeal to you as an important object:	belief s
	a. Increase sum total of human happinessb. Increase power of civilized nationsc. Increase wealth	S P E
4.	Granting ability and opportunity, to what extent do these careers attract you, assuming that any can satisfy your material need:	idea ls
	a. Missionary b. Musician c. Clinic Assistant	R A S

6. To what extent do these famous personages

appeal to you, because of what they seem to embody

in their lives and work:

a. Croesus
b. Socrates
c. Robert Fulton

These variables combine interest and attitude material, therefore the symbol IJ is used with them.

ANALYSIS LW

Lorr, M., Wittman, P., and Schanberger, W. An analysis of the Elgin prognostic scale. J. clin. Psychol., 1951, 7, 260-263.

The subjects were 200 successive admissions at the Elgin State Hospital rated on the Elgin Prognostic Scale by one of the authors and a psychiatrist. The Elgin Scale is a rating schedule designed to predict recovery in schizophrenics. It consists of 20 rating scales weighted according to prognostic importance; favorable factors are arbitrarily assigned negative weights. The prognostic score is the algebraic sum of the weighted measures The variables are in large part based upon premorbid social history secured from the patient's relatives. Tetrachoric correlations were used for 17 of the 20 scale variables. The names of the scales are given in the table of loadings.

ANALYSIS MD

McNamara, W. J. and Darley, J. G. A factor analysis of test-retest performance on attitude and adjustment tests. <u>J. educ. Psychol.</u>, 1938, 29, 652-664.

During the academic year 1935-1936, 326 men and 217 women in the General College, University of Minnesota, were tested on a battery of attitude and adjustment questionnaires and retested over an average interval of 9.2 months. For this study 100 men were selected at random from these larger groups. Mean and standard deviations of scores indicated that the small sample was representative. A separate analysis was carried out for 100 men, the same 100 men retested, 100 women and the same 100 women retested. The factorial results are similar. Only the analysis of the first test for 100 men is reported here.

ANALYSIS ML

Marzoff, S. S. and Larsen, A. H. Statistical interpretation of symptoms illustrated with a factor analysis of problem check list items. Educ. psychol. Meas., 1945, 5, 285-294.

The Mooney Problem Check List was given to 205 upper classmen in Illinois State Normal University. This instrument consists of 330 items about which students might worry. In using the instrument the student is asked to underline those items about which he worries. The 10 most frequently underlined items were intercorrelated using tetrachoric correlations. Oblique rotation (as well as orthogonal).

LOADINGS ON OBLIQUE FACTORS

I.	Lack of	self-confidence	II.	Lack	of	integration
			•			

	Identifications:	Sc	? 1	0
No.	Variables		II_	h ²
\overline{ML} - 1.	Q:Wondering if I'll be successful in life.	-81		64

ML- 9.	Q:Not enough time for recreation.		61	36
ML-10.	Q:Restless at delay in starting life work.			05

This may reflect actual over-worked situation rather than any personality characteristic.

The correlation between factors I and II is .26.

ANALYSIS Mo

Mosier, C. I. A factor analysis of certain neurotic tendencies. Psychometrika, 1937, 2, 263-287.

This study used the items of the Thurstone Neurotic Inventory. Three of the items were dropped from the analysis, since they had consistently low correlations with the other items and among themselves. The score on the A.C.E. Psychological Examination was also used in the analysis. The subjects were 500 male students of the University of Florida. About 100 in the group tested are not included among the 500 used, since they had answered more than 3 items with "?". The few responses of "?" were considered to be "not neurotic" and tetrachoric correlations were used.

- Mo- 1. Do you get stage fright?
- Mo- 2. Do you have difficulty in starting conversation with a stranger?
- Mo- 3. Do you worry too long over humiliating experiences?
- Mo- 4. Do you often feel lonesome, even when you are with other people?
- Mo- 5. Do you consider yourself a rather nervous person?
- Mo- 6. Are your feelings easily hurt?
- Mo- 7. Do you keep in the background on social occasions?
- Mo- 8. Do ideas run through your head so that you cannot sleep?
- Mo- 9. Are you frequently burdened by a sense of remorse?
- Mo-10. Do you worry over possible misfortune?
- Mo-11. Do your feelings alternate between happiness and sadness without apparent reason?
- Mo-12. Are you troubled with shyness?
- Mo-13. Do you day-dream frequently?
- Mo-14. Do you get discouraged easily?
- Mo-15. Do your interests change quickly?
- Mo-16. Does it bother you to have people watch you at work, even when you do it well?
- Mo-17. Can you stand criticism without feeling hurt?
- Mo-18. Do you have difficulty making friends?
- Mo-19. Are you troubled with the idea that people are watching you on the street?
- Mo-20. Does your mind often wander badly so that you lose track of what you are doing?

- Mo-21. Have you ever been depressed because of low marks in school?
- Mo-22. Are you touchy on various subjects?
- Mo-23. Are you often in a state of excitement?
- Mo-24. Do you frequently feel grouchy?
- Mo-25. Do you feel-self-conscious when you recite in class?
- Mo-26. Do you often feel just miserable?
- Mo-27. Does some particular useless thought keep coming into your mind to bother you?
- Mo-28. Do you hesitate to volunteer in a class recitation?
- Mo-29. Are you frequently in low spirits?
- Mo-30. Do you often experience periods of loneliness?
- Mo-31. Do you often feel self-conscious in the presence of superiors?
- Mo-32. Do you lack self-confidence?
- Mo-33. Do you find it difficult to speak in public?
- Mo-34. Do you often feel self-conscious because of your personal appearance?
- Mo-35. Do you feel that you must do a thing own several times before you leave it?
- Mo-36. Are you troubled with feelings of inferiority?
- Mo-37. Do you often find that you cannot make up your mind until the time for action has passed?
- Mo-38. Do you have ups and downs in mood without apparent cause?
- Mo-39. Are you in general self-confident about your abilities?
- Mo-40. Above the median, A.C.E. Psychological Examination.

ANALYSIS No

North, R. D., Jr. An analysis of the personality dimensions of introversion-extroversion. J. Personality, 1949, 17, 352-368.

The subjects were 155 men and 15 women students at Columbia University ranging in age from 19 to 38. All of the subjects filled out the Guilford Inventory of Factors STDCR and the Kuder Preference Record, and took the Army General Classification Test. The analysis was carried out on the Guilford Inventory only. An analysis of the contribution of items in the inventory was made. The following descriptions of the variables adapted from the manual appear in this article:

- No- 1. S-Social Introversion-Extroversion. A high score indicates shyness, a tendency to withdraw from social situations and to be seclusive. Low scores indicate sociability, a tendency to seek social contacts and to enjoy the company of others.
- No- 2. T-Thinking Introversion-Extroversion. A high score indicates an inclination to meditative thinking, philosophizing, analyzing one's self and others, and an introspective disposition. A low score indicates a lack of introspectiveness and an extrovertive orientation of the thinking process.
- No-3. D--Depression. A high score indicates a chronically depressed mood including feelings of unworthiness and guilt. A low score indicates freedom from depression and a cheerful, optimistic disposition.
- No- 4. C--Cycloid Disposition. A high score indicates the presence of cycloid tendencies as shown in strong emotional reactions, fluctuations in mood, and a disposition toward flightiness and instability. A low score indicates stable emotional reactions and moods and freedom from cycloid tendencies.
- No- 5. R-Rhathymia. A high raw score indicates a happy-go-lucky or carefree disposition, liveliness, and impulsiveness. A low score indicates an inhibited disposition and an over-control of the impulses.

ANALYSIS Ri

Richards, T. W. Factors in the personality of nursery school children. J. exp. Educ., 1940, 9, 152-153.

This study used the correlation data presented in Ball, R. S., and Roberts, K. E. A study of personality in young children by means of a series of rating scales. <u>J. Genetic Psychol.</u>, 1938, <u>52</u>, 79-149. The scores were the average ratings of 2 trained teachers on the Merrillipelmer Personality Rating Scales. These were scales constructed after the fashion of the Thurstone Attitude Scales (see <u>Analysis Ch</u>). The intercorrelations where based on 66 to 95 nursery school children whose ages ranged from 48 to 59 months.

ANALYSIS RTA

Reyburn, H. A., and Taylor, J. G. Some factors of personality. A further analysis of some of Webb's data. <u>Brit. J. Psychol.</u>, 1939, <u>30</u>, 151-165.

The subjects were the group of men used by Webb: 194 men students (average age, 21) at a teacher-training college, during the last 6 months of their second year. (Webb, E. Character and intelligence. Brit, J. Psychol. Monogr. Suppl. No. 3, 1915.) The variables were based on ratings on personality traits made by fellow-student prefects or monitors. In groups of 19 or 20 two "judges" rated each subject on each trait making sure their judgments were absolutely independent. Ratings followed 3 months of observation and the writing of a complete personality sketch of each subject; they were made on a 7-point scale, +3 to -3. Webb used 39 traits (6 for Emotions, 6 for Self Qualities, 13 for Sociality, 7 for Activity, and 9 for Intellect) of which 19 are used in this study When the reliability of the ratings--correlation between the 2 judges- or any group of 19 or 20 students fell below about .31 uncorrected, these ratings were entirely rejected. In this way 63 out of 445 pairs of ratings were rejected. (Evidently a slightly different group of subjects was thus retained for each co-efficient in the correlation matrix.)

- RTA-1. General tendency to be cheerful vs. being depressed and low-spirited.
- RTA-2. Tendency to quick oscillation between cheerfulness and depression vs. permanence of mood.
- RTA- 3. Occasional liability to extreme depression.
- RTA- 4. Readiness to become angry.
- RTA-5. Readiness to recover from anger.
- RTA-6. Occasional liability to extreme anger.
- RTA-7. Degree of sense of humor.
- RMA-8. Eagerness for admiration.
- RTA- 9. Fondness for large social gatherings.
- RTA-10. Impulsive kindness (to be distinguished from RTA-11).
- RTA-11. Tendency to do kindnesses on principle.
- RTA-12. Degree of corporate spirit (in whatever body interest is taken, e.g., college, school, country, native place, etc.).
- RTA-13. Trustworthiness, keeping his word or engagement, performing his believed duty.
- RTA-14. Conscientiousness, keenness of interest in the goodness and wickedness of actions.

- RTA-15. Readiness to accept the sentiments of his associates.
- RTA-16. Degree of 'tact' in getting on with people.
- RTA-17. Degree of bodily activity in pursuit of pleasure, games, etc.
- RTA-18. Tendency not to abandon tasks in the face of obstacles.
- RTA-19. Tendency not to abandon tasks from mere changeability.

LOADINGS ON ORTHOGONAL FACTORS

- I. Light-heartedness vs. serious mindedness. Cattell's Surgency-Desurgency.
- III. Charity.
- II. Perseverance. More weight to steadiness and continuity than Webb's 'w' has.

IV. Social sensitiveness
 (not sociability)

²Average reliability over groups of 19 or 20 subjects for ratings retained after low reliability ratings were rejected.

ANALYSIS RTB

Reyburn, H. A., and Taylor, J. G. Factors in introversion and extraversion. Brit. J. Psychol., 1941, 31, 335-340.

The subjects were 115 undergraduate students in psychology. The traits used were selected from a list of Heidbreder's representing ones having highest liagnostic value. These were used to form a self-rating questionnaire using a 5-point scale. The scale and each trait in turn were described orally to the group of subjects.

- RTB- 1. Makes friends easily.
- RTB-2. Is easily hurt by remarks or actions of others.
- RTB-3. Is not suspicious of the motives of others.
- RTB- 4. Does not worry about possible misfortunes (signs reversed).
- RTB-5. Indulges in self pity when things go wrong.
- RTB-6. Keeps his head in excitement and moments of stress (signs reversed).
- RTB-7. Takes prominent part in social affairs and entertainments.
- RTB-8. Is outspoken, blunt, critical (signs reversed).
- RTB- 9. Prefers working with others.
- RTB-10. Is subject to changes of mood without apparent cause.
- RTB-11. 'p', a perseveration test of 3 items taken from Cattell given to 76 of the subjects.

LOADINGS ON ORTHOGONAL FACTORS

I. Perseverance - emotional and conative stability

III. Sociability .

II. Serious-mindedness vs lightheartedness, or Cattell's desurgency

IV. 'p' - a perseveration factor
 found by Cattell

ANALYSIS RTC

Reyburn, H. A., and Taylor, J. G. Some factors of temperament: a re-examination. <u>Psychometrika</u>, 1943, 8, 91-104.

The data used for this study are given in the rotated factorial matrix of Analysis GuB. The rotation was continued, not toward a criterion of simple structure, but toward meaningfulness of the factors. The vectors were placed at the centroids of pairs or small groups of items which seemed logically related. Further rotation was then made so that the loadings on variables 20, 24, and 29 were such as would show the most clear correspondence on 4 factors with the loadings of these variables found in Analysis RTD. These 3 variables were the only ones common to the 2 studies.

ANALYSIS FTD

Reyburn, H. A., and Taylor, J. G. Some factors of temperament: a re-examination. Psychometrika, 1943, 8, 91-104.

The data used for this study are the intercorrelations obtained in Analysis GuC. Guilford's rotated factorial matrix was not used here as in Analysis RTC, because arithmetic errors were found in Guilford's computations. The rotation was carried out, not toward a criterion of simple structure, but toward meaningfulness of the factors. The vectors were placed at the centroids of pairs or small groups of items which seemed logically related. Further rotation was then made so that the loadings on variables 8, 15, and 21 were such as would show the most clear correspondence on 4 factors with the loadings of these variables found in Analysis RTC. These 3 variables were the only ones common to the 2 studies.

ANALYSIS SB

Stewart, N., and Bergmann, C. Cognitive and conative factors in self-ratings and ratings by others. Paper read at convention of American Educational Research Association, 1951.

Separate analyses were made of self-ratings with school achievement, "buddy"-ratings and school achievement, and of all 3 together. Only the results of the large analysis are included here, since the smaller ones were in good agreement with it.

Students in seven sociology and English classes at Queens College, mainly sophomores and juniors, were asked to name the 4 individuals in each class who were most, and the 4 who were least ambitious, efficient, industrious, intellectual, quick-thinking, dominant, aggressive, sociable, and emotional. They were instructed to name themselves wherever they deemed it appropriate. These nominations were quantified to provide a measure of each individual's standing on each trait, as seen by his classmates, and a measure of his standing on each trait a seen by himself. Other scores obtained were:

- SB-19. Authoritarianism. This was a questionnaire containing 10 items from the Berkeley authoritarianism scale, which appears to yield a reasonably valid measure of anti-democratic trends at the personality level. Concerning this instrument Adorno, et al, writes, "Authoritarian personality tendencies; manifested on the surface in a high level of ethnocentrism are evidenced at a deeper level by rigid adherence to conventional values; uncritical acceptance of authoritative power figures and identification of self with such figures; cynicism, suspiciousness, rejection of tender-mindedness; disposition to think in stereotyped categories.
- SB-20. Course Grade. The student's grade in the classes in which the ratings had been made.
- SB-21. High School Average.
- SB-22. College Average. Grade-point average through sophomore year.
- SB-23. Percentile score on the American Council on Education Psychological Examination.

ANALYSIS Sg

Strong, E. K. <u>Vocational Interests of Men and Women</u>. 1943, Stanford University Press. Pp. xxix plus 746.

The subjects were 285 Stanford University senior men. This book discusses several analyses made from these and related data, all of which are said to have yielded very similar results. Reported in the "fifth" analysis for men. Strong's revised blank for men, published in 1938, was used for this analysis. The revised blank for women was published in 1946. These, however, will be considered sufficiently close to the older scales that they will be treated in this survey as parallel variables. In some cases it is not clear whether the revised or older form was used.

The revised blank for men provides lists of 100 "occupations," 36 "school subjects," 49 "amusements," 48 "activities," and 47 "peculiarities of people" about which the subject is to circle L, I, or D, indicating "Like," "Indifferent," or "Dislike"; 40 items requiring selection of most and least preferred activities; 40 items requiring comparison of preference for pairs of items; and 40 items involving self-ratings of "present abilities and characteristics." The revised blank for women has the same categories, but the items are different and the numbers in CaD category differs slightly. Both blanks have a total of 400 items. The responses are keyed to produce scores for some 38 vocations. The table of loadings gives the names of the scales. An analysis of women's occupations is reported in the book, but there was no rotation for that analysis.

ANALYSIS St

Stott, L. H. An analytical study of self-reliance. <u>J. Psychol.</u>, 1938, 5, 107-118.

The subjects were 650 high school sophomores of the Lincoln High School, Lincoln, Nebraska. A set of 30 brief descriptions of the behavior and feelings of young people in common everyday situations served as a basis for the preliminary form of the test. These statements were patterned after those used by Maller in his Character Sketches. Each statement was agreed upon by a group of competent judges as characterizing either the self-reliant or the non-self-reliant individual. For each of the 30 statements as nearly as poseible an exact opposite was then made up making a total of 60 items (30 in positive, and 30 in negative form) for the experimental edi on of the test. These 60 items were mixed at random. The instructions were for the subject to indicate whether or not he considered himself the same as, or different from the person described in the item, or as in some instances, whether he thought he would act the same or differently under the same circumstances. Two analyses were made: one for the positive items (St1) and one for the negative (St2). The items are presented below in the order in which they appeared in the test.

- Stl-1. This person is seldom late for school or work on mornings when he must get up without being called.
- St2-2. When buying an article of clothing this person never likes to decide for himself which particular color or style to choose.
- Stl-3. This person is self-reliant.
- St2-4. Is usually quite upset at examination time because he has put off studying until the last minute.
- St1- 5. Usually gets himself out of a difficult situation without help.
- St2-6. Seld goes ahead with other work besides what he has been told to do
- Stl-7. This person would prefer to arrange his own schedule for study, work and recreation.
- St2-8. Feels "lost" terribly bored when he finds he has "nothing to do" for the evening.
- St2-9. This person has difficulty making up his mind for himself.
- St1-10. Usually faces his troubles alone without seeking help.
- St2-11. Does not care to plan a trip, hike or party; waits to be invited to go along.
- St2-12. If present when a child is injured in a playground accident this person would be unable to decide what should be done until others had taken charge of the situation.
- St1-13. If a difficult task were assigned to the class this person would be one of the last to go for help.

- Stl-14. Is very conscientious in his work.
- St2-15. When working on a committee this person is easily convinced that his idea is not good if someone else does not agree with him.
- St1-16. Is always ready to take the consequences of whatever he does; never blames anyone else.
- St2-17. Dislikes finding his way about ir a strange place.
- Stl-18. Has no difficulty deciding on gifts to buy for others.
- Stl-19. Enjoys planning work for himself and others to do.
- St2-20. Seldom has an idea for making money.
- St2-21. Does not like to work out new ways of doing his everyday tasks.
- St2-22. This person, if traveling, would prefer to be with someone who would be responsible for all necessary arrangements.
- St2-23. This person's suggestions and ideas are seldom made use of in class meetings or committee meetings.
- St2-24. Doesn't mind being a little late for an appointment.
- St1-25. Seems to know what to do in an emergency.
- St2-26. This person would rather not rely upon his own judgment in the use of his money.
- St2-27. Does not like to solve complicated puzzles by himself.
- Stl.-28. Always finds plenty of work to do during his spare time.
- St1-29. Is usually asked to help plan special parties and programs at school.
- St1-30. This person greatly enjoys occasional evenings which he must spend alone.
- St2-31. Seldom faces his troubles alone without seeking help.
- Stl-32. "Usually feels fairly confident at examination time because he has not put off his studying until the last minute.
- St2-33. This person is usually late for school or work on mornings when he must get up without being called.
- St1-34. Never feels "lost" or bored when he finds he has "nothing to do" for the evening.
- Stl-35. Greatly enjoys finding his way about in a strange place.

- Stl-36. Likes to work out new ways of doing his every day tasks.
- St2-37. Seldom finds any work to do during his spare time.
- St1-38. When buying an article of clothing this person much prefers to decide for himself which particular color or style to choose.
- St1-39. Usually goes ahead with other work besides what he has been told to do.
- St2-40. Has great difficulty deciding on gifts to buy for others.
- Stl-41. This person's suggestions and ideas are nearly always made use of in class meetings and committee meetings.
- St2-42. Never enjoys the occasional evenings which he must spend alone.
- St2-43. This person is not self-reliant.
- Stl-44. Has no difficulty making up his mind for himself.
- St2-45. Seldom gets himself out of a difficult situation without help.
- St2-1:6. Is not always ready to take the consequences of what he does; often blames someone else.
- St2-47. Is not conscientious in his work,
- St1-48. If present when a child is injured in a playground accident this person would be one of the first to decide what should be done and to take charge of the situation.
- St2-49. Does not enjoy planning work for himself and others.
- Stl-50. This person would much rather rely upon his own judgment in the use of his money
- St1-51. Greatly dislikes being a little late for an appointment.
- St2-52. Is not often asked to help plan special parties and programs at school.
- St2-53. This person would prefer to let his parents arrange for him his schedule of study, work and recreation.
- Stl-54. When working on a committee this person is not easily convinced that his idea is not good if someone else disagrees with him.
- --St2-55. If a difficult task were assigned to the class this person would be one of the first to go for help.
 - Stl-56. Has lots of idea for making money.
 - Stl-57. Likes to solve complicated puzzles by himself.

- St2-58. This person never seems to know what to do in an emergency.
- Stl-59. Enjoys planning a trip, hike or party; seldom waits to be invited to go along.
- Stl-60. This person, if traveling, would prefer to make his own plans and arrangements.

ANALYSIS ThA

Thurstone, L. L. A multiple factor study of vocational inferests. Personnel J., 1931, 10, 198-205.

This analysis was made from the intercorrelations among the interest scores of 18 professions supplied by E. K. Strong (see <u>Analysis Sg</u> for Strong VIB). Details concerning the original data are not given. The analysis was made by a grouping method so that rotation was not required.

ANALYSIS ThB

Thurstone, L. L. The dimensions of temperament: Analysis of Guilford's Thirteen Personality Scores. Psychometric Laboratory, Univ. of Chicago. No. 42. June, 1947 and <u>Psychometrika</u>; 1951, <u>16</u>, 11-20.

The data used in this analysis were intercorrelations in Lovell, C., A study of factor structure of thirteen personality variables. Educ. psychol. Meas. 1945, 5, 335-350. For the list of variables see Analysis Lo. Since the scores on Guilford's questionnaires represent factor scores, Lovell was analyzing the second-order domain; this required the use of communalities in the diagonals. The present analysis, on the other hand, was designed to find out how many independent factors were really represented by Guilford's 13 scores; this required the use of the test reliabilities in the diagonals.

ANALYSIS To

Torr, D. V. A factor analysis of selected interest inventories. Presentation at Amer. Psychol. Assoc. Meetings, 1952, Washington, D. C. Details on microfilm, Washington Univ., St. Louis.

The subjects were 595 white male United States Air For a airmen undergoing basic training at Lackland Air Force Base. Tetrachoric correlations were used.

- To- 1. Masculinity-Femininity. The scale by this name of the Strong Vocational Interest Blank. See Analysis Sg.
- To-2 through To-11. Thurstone Interest Schedule. Each of 10 occupational fields, represented by 10 different occupational titles in that field, is compared twice with each of the other fields. In a 10 x 10 box chart, the pairs of occupations are so arranged that the first items in any column represent the same field. Similarly, the second items in any row represent the same field. The score for a field is found, then, by counting checks in a row and a column. The subject can mark either, both, or neither items in a pair. The test takes about 10 minutes.
- To-12 through To-29. Guilford-Shneidman-Zimmerman Interest Survey, Form A.

 This is made up of 360 items which have been grouped by the authors into 18 scales, each yielding a measure of hobby interest and vocational interest. The examinee has 3 alternatives from which to choose after reading an item: H, liking as a hobby; V, liking as a vocation; and D, disliking, disinterest or don't know. Both H and V may be chosen. These variables were the sum of the H and V responses for the scales named in the table of loadings.
- To-30 through To-35. Lee Thorpe Occupational Interest Inventory. This provides measures on 6 interest fields of 3 types. The scores are obtained from 120 pairs of activities in forced-choice form. Each alternative is keyed for one field of interest. The sum of the responses on any key is converted to a centile rank through the use of norms provided by the authors. For this experiment the inventory was presented in free-choice form.
- To-36 through To-41. <u>Texas Occupational Interest Analyzer</u>. This consists of pairings of vocational titles each of which is keyed for one of the 6 scales. The subject checks one or both as liked or both as disliked.
- To-42 through To-48. Brainard Occupational Preference Inventory. This has 140 activities keyed for 7 scales. The items are responded to on a 5-point scale from 2 to -2.
- To-49. Biographical Inventory after Sims. This is an Air Force adaptation of the Sims Score Card for Socio-Economic Status with 26 biographical items.

ANALYSIS Ts

Tschechtelin, S. M. A., Factor analysis of children's personality rating scale. J. Psychol., 1944, 18, 197-200.

The subjects were 300 selected at random from 1600 4th through 8th grade children to whom the 22-Trait Personality Rating Scale had been administered. The variables used were the average rating by 8 classmates. Tetrachoric correlations were used.

LOADINGS ON ORTHOGONAL FACTORS

ANALYSIS Ty

Tyler, F. T. A factorial analysis of fifteen MMPI scales. <u>J. consult.</u> Psychol., 1951, <u>15</u>, 451-456.

The subjects were 107 female graduate students at the University of California, Berkeley, preparing to become elementary teachers. Rotation was to both orthogonal and oblique solutions. The two were very similar; only the oblique solution is reported here.

Variables $\underline{\text{Ty-1}}$ through $\underline{\text{Ty-9}}$ are scales of the MMPI given by name in the table of loadings (see Analysis Co).

Variable Ty-10 through Ty-15 are the "Social Scales" of the MMPI.

- Ty-10. Si, Social Introversion. Tendency to avoid social contacts, little dependency upon people
- Ty-11. St, Status. Self-confidence, poise, resourcefulness
- Ty-12. Pr., Prejudice. Cynicism, poor morale, suspiciousness, feelings of ill will, lack of faith in others
- Ty-13. Ac, Academic Achievement. Tenseness, docility, insecurity (producing greater academic output)
- Ty-14. Re, Responsibility. Dependability, integrity, seriousness, steadiness, tenacity
- Ty-15. Do, Dominance. Optimism, persuasiveness, self-discipline, resoluteness

LOADINGS ON OBLIQUE FACTORS

- I. General Maladjustment

 IV. Social Adjustment, Self

 II. Conflict, Lack of Insight,
 Dissatisfaction

 V. Femininity
- III. Social Aggressiveness

ANALYSIS WB

Wittenborn, J. R., Bell, E. G., and Lesser, G. S. Symptom patterns among organic patients of advanced age. <u>J. clin. Psychol.</u>, 1951, 7, 328-331.

The analysis was based upon symptom rating scales for 120 patients at the Connecticut State Hospital at Middletown who were over 60 years of age and who were suffering from a psychological or mental disorder having a known physiological basis. The table of loadings gives an extreme item, somewhat abbreviated, in each of the scales used. The variables are all identical to those in Analysis WM. For unabbreviated variables see Analysis WH.

ANALYSIS WH

Wittenborn, J. R., and Holzberg, J. D. The generality of psychiatric syndromes. <u>J. consult. Psychol.</u>, 1951, <u>15</u>, 372-380.

The subjects were 250 patients at the Connecticut State Hospital at Middletown. They included make and female patients admitted during the first 6 months of 1949 who suffered disturbances which were not believed to be due to toxic or neurological factors and who were under 60 years of age. The subjects were rated on symptom rating scales during their first few weeks at the hospital. The pathological extreme of each scale is given in the table of loadings. Four scales out of 55 were omitted from the analysis because of low intercorrelations. With this exception the variables are the same as those in Analysis Wi.

ANALYSIS Wi

Wittenborn, J. R. Symptom patterns in a group of mental hospital patients. J. consult. Psychol., 1951, 15, 290-310.

The subjects were 140 patients at the Northampton Veterans Hospital. Although they were all males, they varied greatly with respect to age, educational attainments, social status, cause of illness, and presenting symptoms. The subjects were rated on symptom rating scales by psychiatrists and psychiatric nurses. The pathological extreme of each scale in somewhat abbreviated form is given in the table of loadings. Five scales out of 55 were omitted from the analysis because of low intercorrelations. With this exception the variables are the same as those in Analysis WH. For unabbreviated variables see Analysis WH.

ANALYSIS WL

Wheeler, W. M., Little, K. B., and Lehner, G. F. J. The internal structure of the MMPI. J. consult. Psychol., 1951, 15, 134-141.

The subjects were 110 neuropsychiatric male patients in a veterans hospital in Los Angeles, ranging in age from 20 to 63 with the mean at 33, and 112 male college students at UCIA. An analysis of the two groups combined as well as separate analyses are reported in the article but the one for the combined group is not reported here. For descriptions of the MMPI scales used as variables see Analysis Co.

SUPPLEMENTARY ANALYSIS LIST

This list contains references to analyses that have been omitted from full coverage in the survey for reasons other than the general principles of selection laid down in the <u>Introduction</u>. Following each reference, the reason for its omission is briefly explained.

- Andrews, T. G. A factorial analysis of responses to the comic as a study in personality. J. gen. Psychol., 1943, 28, 209-224. The factors found pertain to kinds of humor rather than personality traits.
- Cattell, R. B. Simple structure in relation to some alternative factorizations of the personality sphere. J. gen. Psychol., 1946, 35, 225-238. This is a re-rotation of Analysis CaA not considered by Cattell to be superior to his original rotation.
- Cattell, R. B. The dimensions of culture patterns by factorization of national characters. J. abn. soc. Psychol., 1949, 44, 443-469. The variables were characteristics or statistical data on national groups. Some of the factors resemble personality factors. Jut they cannot be considered strictly comparable to those derived from analyses of individual scores.
- Cattell, R. B., and Gruen, W. Measurement of the primary personality factors in children by means of objective tests. Lab. Pers. Asses. and Group Behavior, Univ. Ill. This is a valiant and extensive analysis of tests in the tradition of Analysis CaD. However, beyond identification of Reaction Time and G, identification with personality factors is not reasonably possible at this time.
- Cattell, R. B., and Wenig, P. W. Dynamic and cognitive factors controlling misperception. J. abn. soc. Psychol., 1952, 47, 797-809. This is an ingenious study of psychological processes or mechanisms acting under given stimuli and controlled mood. The authors name the design condition-response factor analysis. The nature of the variables and the stimuli do not lend themselves to comparability on the same terms as analyses covered in this book.
- Coffman, W. E. Teacher morale and curriculum development: a statistical analysis of responses to a reaction inventory. Thesis. Adv. Sch. Educ., Teacher Coll., Columbia Univ., 1949. Concerns behavior with respect to a situation too specific to teaching to be included here.
- Darling, R. P. Autonomic action in relation to personality traits of children. J. abn. soc. Psychology., 1940, 35, 246-260. Of the 4 factors, one reflects halo, 2 reflect overlapping error variance.
- Duffy, E. Level of muscular tension as an aspect of personality.

 J. gen. Psychol., 1946, 35, 161-171. General factor found. The factors found are not comparable to personality factors.
- Ewart, E., Seashore, S. E., and Tiffin, J. A factor analysis of an industrial merit rating scale. J. appl. Psychol., 1941, 25, 481-486. Concerns behavior with respect to a situation too specific for inclusion here.

- Eysenck, H. J. Schizothymia-Cyclothymia as a dimension of personality: II. Experimental. J. Personality, 1952, 20, 345-384. The structure here is fairly simple, although the rotation was not done with this in mind. The variables, however, are mainly tests that are not directly interpretable in terms of personality factors.
- Ferguson, L. W. A factor study of the traits of the Dionne quintuplets. Psychol. Rec., 1940, 4, 1-8. Inadequate structure. One general factor of maturation; the others are uninterpretable.
- Fiske, D. W. Consistency of the factorial structures of personality ratings from different sources. J. abn. soc. Psychol., 1949, 44, 329-344. Structure is poor and interpretation is hampered, because the positive direction of the variables is not indicated.
- French, J. W. The West Point tryout of a comparative prediction battery. Unpublished. This is a large analysis devoted mainly to aptitude tests and course grades, but it includes 6 information scores for interest measurement and a leadership rating. Factor Is appears in the information tests with a high loading on science and a lower one on mechanics and art. A factor with a high loading on social information and a lower one on athletic information and leadership rating may be Factor Gr.
- Gannon, J. F. A statistical study of certain diagnostic personality traits of college men. Stud. Psychol. Psychiat., Cathol. U. Amer., 1939, 4. pp. 45. Interpretation was not possible partly because of unclear structure. The analysis used rating items selected from a larger group of items on the basis of their high intercorrelations. They were all in an "extrovert group" of items, probably too homogeneous to analyze successfully.
- Gibb, C. A. Personality traits by factorial analysis (III): item analysis of personal inventory. Aust. J. Psychol. Phil., 1942, 20, 203-227. Inadequate structure probably resulting from failure to extract all the factors. Very similar items have very different loadings.
- Gordon, L. V. A comparison of the validities of the forced-choice and questionnaire methods in personality measurement. Ohio State U., 1950. Thesis. Includes 2 analyses of 150 questionnaire items each. Use of Wherry-Doolittle method of analysis restricts number of factors extracted to those aimed for in the item construction.
- Gordon, O. J. A fector analysis of human needs and industrial morale. 1952. Unpublished thesis. Univ. Utah. General morale factor and four others pertaining to fulfillment of needs. The factors may be specific to this industrial situation and could not as yet be directly related to personality factors.
- Guertin, W. H. A factor analysis of some Szondi pictures. <u>J. Clin.</u> Psychol., 1951, 7, 232-235. Clusters among the Szondi scales cannot yet be compared directly with personality factors.
- Guertin, W. H. A factor analysis of the Bender-Gestalt tests of mental patients. J. clin. Psychol., 1952, 8, 362-367. The factors derived from the mechanical responses to the Bender-Gestalt cannot yet be related to personality factors, because other personality variables were not included in this analysis.

- Hampton, N. D. An analysis of supervisory ratings of elementary teachers graduated from Iowa State Teachers College. J. exp. Educ., 1951, 20, 179-215. The ratings are too specific to the attitude of teachers toward their job and do not seem to reflect personality directly.
- Harsh, C. M. A factorial analysis of the responses to an annoyance inventory. Psychol. Bull., 1935, 32, 535. Annoyances have the same logical relation to personality measurement that interests have, but there have not yet been enough analyses of annoyances to have structured them in a way that a survey of them would be contributory.
- Hellfritzsch, A. G. A factor analysis of teacher abilities. <u>J. exp.</u>
 <u>Educ.</u>, 1945, <u>14</u>, 166-199. Variables include intelligence tests, whole inventories and scales, and teachers attitude and ability measures. The factors are either too specific to teaching or difficult to interpret because of the complexity of the variables.
- Hsu, E. H. The Rorschach responses and factor analysis. J. gen. Psychol., 1947, 37, 129-138. The factors in this area are not directly comparable to personality factors.
- Hsu, E. H. Comparative study of factor patterns, physiologically and psychologically determined. J. gen. Psychol., 1952, 47, 105-128. An interesting novel approach, but not strictly an analysis of personality measurements.
- Hughes, R. M. A factor analysis of Rorschach diagnostic signs. <u>J. gen. Psychol.</u>, 1950, 43, 85-103. The Rorschach variables used here were those described in the literature as diagnostic of psychoneurosis, organic pathology, or schizophrenia. Nevertheless, the factors are not directly comparable to personality factors.
- Kaleemeier, R. W., and Dudek, F. J. A factorial investigation of flexibility. Educ. psychol. Meas., 1950, 10, 107-118. In this analysis of aptitude tests some of which required shifts of task, only aptitude factors appeared.
- Koch, H. L. A multiple-factor analysis of certain measures of activeness in nursery school children. J. gen. Psychol., 1934, 45, 482-487. and Koch, H. L., and Streit, H. A study in rating technique with special reference to activity in preschool children. J. gen. Psychol., 1932, 41, 330-357. The factors pertain to categories of play rather than personality traits.
- Mac Crone, I. D., and Starfield, A. A comparative study in multiple-factor analysis of "neurotic" tendency. <u>Psychometrika</u>, 1949, <u>14</u>, 1-20. Inadequate structure.
- Martin, G. C. A factor analysis of the Bernreuter Personality Inventory. Educ. psychol. Meas., 1948, 8, 85-92. The factors are produced by overlapping items.
- McCloy, C. H. A factor analysis of personality traits to underlie character education. J. educ. Psychol., 1936, 27, 375-387. This study shows one almost general factor probably produced by rating halo. The effect may be exaggerated since the study used 43 variables with only 31 subjects. Uses Webb's intercorrelations.

- Moore, T. V., and Hsu, E. H. Factorial analysis of anthropological measurements in psychotic patients. <u>Human Biology</u>, 1946, <u>18</u>, 133-157. The factors in this area are not directly comparable to personality factors. Inadequate structure.
- Oliver, J. A., and Ferguson, G. A. A factorial study of tests of rigidity. Canad. J. Psychol., 1951, 5, 49-59. The factor identified as Rigidity by the author seems to the present writer more like the Army Air Force's factor called Integration. This places the analysis in the aptitude rather than the personality domain.
- Rafferty, J. A., and Deemer, W. L., Jr., Factor analysis of psychiatric impressions. <u>J. educ. Psychol.</u>, 1950, <u>41</u>, 173-183. Inadequate structure. Variables not easily compared with personality factors.
- Rees, W. L., and Eysenck, H. J. A factorial study of some morphological and psychological aspects of human constitution. J. ment. Sci., 1945, 91, 8-21. The factors in this area are not directly comparable to personality factors. Inadequate structure.
- Reyburn, H. A., and Raath, M. J. Primary factors of personality. <u>Brit. J. Psychol. Slat. Sec.</u>, 1950, <u>3</u>, 150-158. The data consisted of ratings of a different pair of subjects for each of 80 observers. The rotated loadings are not presented in the article.
- Roff, M. A factorial study of the Fels Parent Behavior Scales. Child Dev., 1949, 20, 29-45. The factors are those pertaining to the specific behavior of parents toward children. This is too specific for inclusion here.
- Ryans, D. G. A study of criterion data (a factor analysis of teacher behaviors in the elementary school). Educ. psychol. Meas., 1952, 12, 333-344. Concerns behavior with respect to a situation too specific to teaching for inclusion here.
- Ryans, D. G., and Wandt, E. A factor analysis of observed teacher behaviors in the secondary school: a study of criterion data. <u>Educ. psychol. Meas.</u>, 1952, <u>12</u>, 574-586. Concerns behavior with respect to a situation too specific to teaching for inclusion, here.
- Scheier, I. H., and Ferguson, G. A. Further factorial studies of tests of rigidity. Canad. J. Psychol., 1952, 6, 18-30. The factor of "cognitive rigidity" that was found seems to be an aptitude factor. See Oliver and Ferguson (Supp. Analysis).
- Schmid, J., Jr. Factor analysis of prospective teacher's differences. J. exp Educ., 1950, 18, 287-319. Concerns an area to specific for inclusion here. Inadequate structure.
- Strong, E. K., Jr., and Tucker, A. C. The use of vocational interest scales in planning a medical career. <u>Psychol. Monog.</u>, 1952, <u>66</u>, 48-51. Too specific for inclusion here, particularly because measurement of closely allied interests by the <u>Strong Blank</u> means an overlapping of the variables. A medical interest factor was found, and <u>Factor Iw</u> is defined by Personnel Manager, two Psychiatrist scales, Psychologist, and Internist.

- Vernon, P. E. An analysis of the conception of morale. Char. and Pers., 1941, 9, 283-294. The area studied here, attitude toward the war, is too specific to be interpreted in terms of personality factors. Inadequate structure.
- Vernon, P. E. Classifying high-grade occupational interests. J. abn. soc. Psychol., 1949, 44, 85-96. The data are average ratings by judges of the likeness of job titles; the judges' own interests were not being measured. An unusual type of correlation coefficient is used; rotation was done on the second, third, and fourth factors, leaving the first as a general "gregariousness" factor; all the factors were not extracted. In spite of these things the resulting factors bear a close resemblance to those in Analysis CD.
- Wenger, M. A. A further note on the measurement of autonomic balance. Psychosom. Med., 1941, 3, 427-434; 1942, 4, 94; 1943, 5, 148-151; Human Biology, 1942, 14, 69-84. The factors in this area are not directly comparable to personality factors.
- Wenger, M. A. An attempt to appraise individual differences in level of muscular tension. J. exp. Psychol., 1943, 32, 213-225. The factors in this area are not directly comparable to personality factors.
- Whisler, L. D. Multiple-factor analysis of generalized attitudes. <u>J. soc.</u> Psychol., 1934, 5, 283-297. Analyzed by grouping method, but structure is not clear. Variables were subjected to a selective process.
- Winne, J. F. The factorial composition of normal and neurotic responses to an adaptation of the MMPI. 1949, Univ. Mich., Univ. Microfilms, Ann Arbor, Mich. Inadequate structure.
- Wittenborn, J. R. A factor analysis of discrete responses to the Rorschach ink blots. <u>J. consult. Psychol.</u>, 1949, <u>13</u>, 335-340. The factors in this area are not directly comparable to personality factors.
- Wittenborn, J. R. A factor analysis of Rorschach scoring categories. J. consult. Psychol., 1950, 14, 261-267. The factors in this area are not directly comparable to personality factors.
- Wittenborn, J. R. Level of mental health as a factor in the implications of Rorschach scores. J. consult. Psychol., 1950, 14, 469-472. The factors in this area are not directly comparable to personality factors.

PART II

FACTORS

The factors which have been identified in at least two analyses with sufficient certainty to receive a name are described in Part II. Each factor has been given code letters to denote its name. A capital letter ordinarily stands for the first letter in the name. A second letter or first letter in the second word of the name is sometimes added as a small letter. The code designation appears at the top of every page of Part II. The descriptions of the factors appear in alphabetical order by these code designations. At the back of the volume there is an index of factor names (Index III) including both those used by the writer and those used by the authors of the analyses. For each factor the following items are presented:

- l. The factor name and code letters. These are given in the heading for each factor. The name represents the interpretation of the writer which tries to be most helpful in the light of all the literature covered, but which, while being influenced by suggested names, is not necessarily the same as the name given by any author who found the factor.
- 2. <u>List of analyses</u>. The analyses in which the factor appears are listed by their code letters. To the right of the code letters a question mark is used to indicate the uncertain identification of the factor in that analysis; a question mark with "c" indicates that the factor was combined with some other factor in the analysis.
- 3. Description of the factor. Following a brief, formal definition of the factor, there is some comment on its clarity of identification and specific problems that were encountered. It was not thought worth-while to enter into a prolonged discussion of reasons for all the cross-identifications that were made. Such an endeavor would result in a cumbersome demonstration of ratiocination and rationalization. In this survey, as compared to Psychometric Monograph, No. 5, fewer cross-identifications could be made with the benefit of overlapping variables; more had to be made on the basis of psychological interpretation. Unfortunately the standard for accepting a cross-identification could not be placed very high lest the survey lose its value because of sheer negativism. The reader must judge the usefulness of the cross-identifications with reference to his particular problem.
- 4. List of variables. The variables which are the best measures of the factor are listed. For each variable is given its name or short description, references to the analyses in which it appears and the factor loadings found in those analyses. The variables are listed in an order derived from (1) their loadings on the factor, (2) the frequency with which they appeared in analyses which separated the factor, and (3) the smallness of loadings on other factors. This complication was introduced in what is thought to be a moderately successful effort to cause the variables at the top of the list to be most truly representative of the factor. Nevertheless, the presence of composit factors, differences in statistical method between analyses, the reliability of variables, and probably many other irrelevant elements affect size of loadings and consequent position in the list. It is possible that the writer could have used his judgment in correcting for these elements, and so could have arrived at a more appropriate order of variables in the list. However, it seemed wiser to be objective and to let the reader be cautious.

5. Supplementary Factor List. At the end of Part II there appears a list of the factors whose interpretation seems possible, but which are not described in full, because they were identified in one analysis only.

FACTOR A: Agreeableness

Analyses: BaB CaA Ho?c Ri? Во CaB Ko? RTA BrA? CaC Lo ThB MD? Ts BrB HJ?

Readiness both to comply with the desires of others and to initiate activity that will serve the desires of others through understanding and tolerating their needs.

An alternative name for this factor might be cooperativeness. This term, however, is too specific, although a tendency to cooperate could produce the other or parallel traits that characterize the factor, namely: agreeableness, affection, sympathy, good personality, kindness, and good nature. This is Cattell's <u>Factor A</u>, <u>Cyclothymia - Schizothymia</u>. Cyclothymia is evidently used here by Cattell as an opposite of the withdrawn, antisocial attitude of the schizoid personality, rather than as an indication that this factor gives evidence for cyclical moods.

Tests with high loadings on this factor:

1. R:Rating on cooperation.

BaB-3 (A60); Bo-8(A58, De38, ?33, ?30, J?25); Ts-9(A56, ?35)

2. Q:Guilford-Martin Personnel Inventory I, Cooperativeness score. ThB-13 (A72,?43); Lo-13 (A69,E?-36,Cd?-25)

3. Q:Guilford-Martin Personnel Inventory I, Agreeableness score.
ThB-12 (A66); Lo-12 (A75,Cd?-33)

4. R:Tendency to be affectionate. BrB-22 (A78)

5. R:Sympathetic.

BaB-21 (A50); BrB-19 (A69)

6. R:Readiness to cooperate vs. obstructiveness.

CaB-1 (A49,?-47); CaC-1 (A55,Pe45); SaB-81 (?-21+)
7. R:Degree of corporate spirit in college, school, country, etc.

RTA-12 (A66, ?46)

8. R:Personality.

Bo-1 (A63, ?38, ?37)

9. R:Out-going, idealistic, cooperative vs. anti-social, schizoid.
CaA-14 (A59,So32)

10. R:Tendency to do kindnesses on principle.

RTA-11 (A59, Pe49, Ei?-47)

11. R:Good-natured, easy-going vs. spiteful, grasping, critical.

CaC-12 (A50); CaB-12 (A34, Pe25); SaB-92(--)

12. R:Good-natured, easy-going vs. surly, hard. CaA-9 (A51, Do-28)

13. R:Natural, friendly, open vs. spiteful, tight-fisted, superstitious. CaA-19 (A49,So31,Su27)

Factor Al: Alertness

Analyses: GuB

Awareness of surroundings, lack of absent-mindedness.

Perception of one's own alertness is probably fairly accurate, since its opposite, absent mindedness, is very apparent and is thus readily admitted. For this reason the questionnaire method is satisfactory for this factor.

Tests with high loadings on this factor:

- 1. Q:Usually keeps in close touch with things going on around him. GuB-9 (A178); RTC-9 (A163,So49)
- 2. Q:Not less attentive than most individuals to things going on around him. GuB-21 (A175); RTC-21 (A157,So55)
- 3. Q:More alert to immediate surroundings than the average person. CaE-39 (--); GuB-30 (A154); RTC-30 (A155); SaB-39 (So59)

FACTOR Au: Autistic Tendency

Analyses: Bt La CaE?c SaB

Habit of using reverie to escape from the unpleasantness of an environment felt to be threatening.

Although daydreaming is the predominant quality for this factor, the association of anxiety with it is important. A tendency to daydream creatively or to daydream as a result of monotonous manual work would not be included. Variable 4 indicates that books as well as daydreams can sometimes provide the desired escape.

Tests with high loadings on this factor:

1. Q:Daydreams,

BT-1 (Au52, Gs-34); CaE-11 (?36,?-28,Ne-26); GuA-13 (Cd42,Sf-31); Mo-13 (Au62); SaB 11 (Au70)

2. Q:Has fits of anxiety or dread without reason.

SaB-41 (Au61), CaE-41 (?41,?34)
3. Q:Often feels lonesome with other people.

BT-12 (Auh8,Gs-44); CaE-8 (?76); CSA-17 (?61); Mo-4 (Lo68,Au47); SaB-8 (?60,Ip36,Au26,?26)

4. Q:Books have been more entertaining than companions. BT-9 (Au55,Gs-52)

5. Q:Daydreams instead of doing work. La-43 (Au50,Cd40,Ne39)

6. Q:Frequently burdened by a sense of remorse Mo-9 (Au48,Cd30,Lo27)

7. Q:Ideas run through head so as to prevent sleep.
Mo-8 (Au47,E26)

8. Q:Often feels worried or tense without cause. SaB-7 (Au45,?43); CaE-7 (?70)

FACTOR Ax: Anxiety

Analyses: Be?

Be? Wi

WB WM

WH

Unshakable fear or uneasiness without external reference.

Also called free-floating anxiety. It has been identified as a factor only with abnormal subjects. See also Factor Cd.

Tests with high loadings on this factor:

1. C: Feelings of impending doom.

Wi-18 (Ax69); WB-10 (Ax77); WM-10 (Ax65); WH-18 (Ax65)

2. C:Delusional belief that he is evil.

Wi-5 (Ax73, Ma-25); WB-2 (Ax78); WM-2 (Ax79); WH-5 (Ax72)

3. C:Cannot believe that he can be helped.

WB-11 (Ax67); WM-11 (Ax80,?-28); WH-22 (Ax65); Wi-22(Ma-47,?35,Hy28,Ax--)

4. C:Desperately distressed by his anxiety.

Wi-28 (Ax78); WH-28 (Ax44,?37)

5. C:Has made attempts at suicide.

WH-40 (Ax56); Wi-40 (Ax59)

C:Shows failure and blocking.
 Wi-49 (Ax68); WH-49 (Ax35)

FACTOR Cd: Cycloid Tendency

Analyses: CaE?c GuB? No?

Dt? La RTB

Fl?c Lo? SaB?c

GuA Mo ThB?

Alternation between normalcy and depression without external reference.

The periods of low mood are without reference to reality, but differ from the state described as $\underline{Factor\ Ax}$ by being moods of depression rather than of fearfulness. See also $\underline{Factor\ Lo}$.

Tests with high loadings on this factor:

1. Q:Has ups and downs in mood without cause.

Mo-38 (Cd85,Au25); RTB-10 (Cd74)

Q:Has ups and downs in mood. GuA-23 (Cd57); La-26(cd82)

2.

3. Q:Feelings alternate between happiness and sadness without reason.
Mo-11 (Cd81,Au27)

4. Q:Frequently has spells of the blues without reason.

La-30 (Cd80, Ne32, E29, Mp25)

5. Q:Inclined to worry over possible misfortunes.

GuA-15 (Cd54); GuB-10 (Cd?63); Mo-10 (Cd41,Au32,So-25); RTB-4
(E?35,Cd30); RTC-10 (Mp38,Rh-34,So-26,?-26)

6. Q:Often just miserable for no sufficient reason.

CaE-6 (?69); La-34 (Cd81,E34); Mo-26 (Lo56,Cd43,E30); SaB-6 (?45,Sc-45,Au33)

FACTOR Cu: Culture

Analyses: CaA? CaC CaB SaB?

Sufficient intelligence combined with the intellectual and artistic interests characteristic of polite society.

A factor in the aptitude-achievement domain based on only one analysis was named <u>Culture</u> in <u>Psychometric Monograph</u>, No.5. To call this one and that the same factor is not inconsistent with the slim evidence for its identification in either domain. This is Cattell's Factor K.

Tests with high loadings on this factor:

1. R:Intellectual, cultured vs. boorish.
CaB-10 (Cu39, Pe32, Su26); CaC-10 (Cu56) SaB-90 (Pe34+, ?27+, Ip23+, Cu?21+)

2. R:Polished vs. clumsy, awkward. CaB-21 (Cu32); CaC-21 (Sf78,Cu57,Ei-26,Su-25); SaB-101 (Pe30+,Cu?--)

FACTOR Cv: Conventionality

Analyses: CaB CM CaC CSA? CaF SaB

Favorable attitude toward strict conventionality vs. eccentricity with artistic and intellectual interests.

This is not a clearly defined factor. In the positive direction it seems to combine stable or conservative attitudes with prudery and neatness. In the negative direction lack of conventionality may be a reflection of neglect caused by an infatuation with being artistic and intellectual. This is Cattell's Factor M, Spiessburger Concernedness vs. Bohemian Intellectualism. The component of intellectuality is based only on the poor evidence of variables 9 and 10. These constitute the only evidence for cross-identification with the factors in Analyses CaF and CM. If it were not for variable 3 below, these factors could have been identified as Factor Ie. It is also possible that the factor in Analyses CaF and Cm should be identified as Factor G.

Tests with high loadings on this factor:

X:Does not want to listen to music.
 CaF-11 (Cv52); CM-15 (Cv52, If-27, ?-25)

2. J:Annoyed by violation of manners or morals. CaE-77 (?-69,?57) SaB-77 (Cv58,Sf31)

3. X:Does not want to know more science.
CaF-16 (Cv50); CM-16 (Cv33, Ia?31)

4. J:Agrees that family gives more happiness than many friends. CaE-72 (Sf?-31);SaB-72 (Cv53)

Carroll, J. B. The factorial representation of mental ability and academic achievement. Educ. psychol. Meas., 1943, 3, 307-332.

FACTOR Cv (Continued)

5. X: Wants to be smartly dressed.

 $CaF - 36 (C_1 52, ?30)$

6. J:Favors subservience to the state and anti-vivisection vs. nudity and free sex.

CaE-69 (?32,Re30,?-27); SaB-69 (Se54,Cv50)

R:Conventional vs unconventional, eccentric.
CaB-25 (Cv32); CaC-25 (Cv37,?-25); SaB-105 (Pe27+,Ss-22+,Do-20+)

8. X:Does not like to see fine paintings and sculpture.

CaF-3 (Cv44)

7.

9. R:Practical, logical vs. sensitively imaginative.

CaB-29 (Cv32,?-28,Cu-28,Do?25); SaB-109 (E-23+,Se-22+,Do-21+,Cv--);

CaC-29 (E-40,A-36,Cu-32,Cv27)

10. R:Lacking artistic feeling vs esthetically fastidicus.

CaB-31 (?-35,Cv--); CaC-31 (Sf-42,Cu-41,So?-34,Cv31); SaB-111 (Cv--)

FACTOR De: Dependability

Analyses: BC? Kr Bo' St2 BrB

Disposition to comply exactly with the requirements of authority.

With the exception of Analysis Bo, the existence of this factor results from the reactions and behavior of school children. Even with Analysis Bo included, there is some reason to feel that this factor is concerned with a superficial kind of dependability. However, the kind of dependability on a job that we consider important may differ from this factor only by combining intelligence or, perhaps, honesty with it. Slim evidence that this is a different factor from Persistence is provided by Analysis Kr. Fair evidence that it differs from Intelligence is provided by Analysis BrB. There is no evidence concerning its independent existence from Honesty.

Tests with high loadings on this factor.

1. R:Punctuality.

Bo-3 (De68, ?33, A28); Ts-7(?49, A31)

2. Q:Does not like to be late for an appointment. Stl-51 (941,Gs?-30); St2-24 (De65)

R:Relied on to do cheres around school.
 Kr-12 (De65, Ei?51, Pe?44, ?25)

4. R:Keeps his promises.

Kr-10 (De64,G49,W1-37)

5. R:Dependability.

Bo-7 (De64,A39,?38,?32); Ts-22 (?56)

6. R: Is obedient.

Kr-15 (De63,Ei?39,Pe?38)

7. R:Diligent attitude toward school work.
BrE-5 (De61)

8. R:Thoroughness.

Bo-4 (De57,?50,?39)

9. R:Obedience in class. BrB-8 (De55)

FACTOR De (Continued)

10. Q:Not usually late for school or work. Stl-1 (Gs?-44); St2-33 (De55,Gs?-26)

11. Q:Is self-reliant.

Stl-3 (Gs?-37,Ss31,?30); St2-43 (De50,?33)

12. R:Reliability: preparing homework, keeping promises, honesty, diligence.
BrB-4 (De49,G30)

FACTOR Do: Dominance

Analyses: BC Gi?c SaB CaA HJ? SB CaB? Ho? ThB? CSA? La

Habit of speaking so as to cast oneself in a superior light.

This factor represents dominance in the sense of variability in amount of dominating or aggressive behavior, mainly verbal behavior. Actual superiority of status or motivation to attain such status by effort or ingenuity is not implied. It is likely that this kind of aggressiveness stems from frustration or other maladjustment, but the factorial data throws no light on that. This is Cattell's Factor E.

Tests with high loadings on this factor:

1. R:Buddy rating on dominance.

SB-11 (Do82, ?26)

2. Q:Soretimes tries to argue or bluff his way past a guard or doorman. CaE-16 (?41,?-27); La-29 (Do61); SaB-16 (Do62, So28, ?26)

3. Q:Questionnaire on overt aggression.

BC-7 (Do69,Ss?27)

4. R:Buddy rating on aggressiveness.

SB-13 (Do66)

5. Q:Sometimes "heckles" a public speaker.

BT-6 (Ss-30); La-35 (Do55)

6. Q:Self rating on dominance.

SB-12 (Do52,?27)

7. Q:Complains about bad food in a restaurant. CaE-15 (G?34,?31); SaB-15 (Do52,?-41)

8. Q:Sometimes upbraids a workman who fails to have his work done on time. La-31 (Dd51)

9. Q:Questionnaire on overt aggression.

BC-20 (Do51,?40,Me-25)

10. Q:Questionnaire on sadism.

BC-8 (Do50,?-28)

11. R:Self assertive vs. self submissive.

CaA-1 (Do39,A-33)

12. R:Wilful, egotistic, predatory vs. mild, self-effacing, tolerant. CaA-7 (Do35,A-31)

FACTOR Dt: Deterioration

Analyses: LW WH?c WB?c Wi

WB?c WM?c

Non-compliance with ordinary social requirements because of poor understanding characteristic of dementia.

This factor has been found only with abnormal subjects. It seems possible that it could represent variance at the unfavorable end of Factor A, but there is no objective evidence for or against this possibility.

1. R:Elgin Stubborn Traits scale.

LW-10 (Dt84)

2. R:Elgin Careless Indifference scale. LW-9 (Dt84)

3. C:Characteristically oppositional.

4. C:Lies or steals.

Wi-53 (Dt56); WH-53 (omitted: low correlations)

5. C:Unaware of the feelings of others.

Wi-8 (Dt52, Ex30, Ps26, Ma-25); WB-4 (?59, ?33); WH-8 (?70); WM-4 (?62)

6. C:Incontinent because of own negligence.

Wi-16 (Dt47, Ma-41, Ex34); WB-9 (?42, Ex?28) WH-16 (?74); WM-9 (?62)

FACTOR E: Emotionality

Analyses: Abl? CaD? CW?c HJ? MD SaB WLl Ey Ho? Mo Ab2?c CE RTB WL2 FK? Lo? CaA Co Gi?c La RTD? CaC CSA?

Chronic excessiveness of emotionality and its attendant symptoms or neurotic tendency.

This factor represents the continuum from the normal, calm, though somewhat phlegmatic disposition to the neurotic, maladjusted, highly emotional disposition often accompanied by nervous fatigue and psychosomatic symptoms. The coverall nature of the terminology in this area makes it hard to be confident of the cross-dientifications. However, this does seem to be one of the most universally important of the personality factors. This is evidently the characteristic called general neuroticism or neurotic tendency, but its important variability within the normal range makes this terminology inappropriate. It is the inverse of Cattell's Factor C. See Factor Hy and Analysis Abl for possible sub-factors.

Tests with high loadings on this factor:

FACTOR Ei: Emotional Immaturity

Analyses: BC? CaB?c HJ
BrB CaC Kr?
CaA CSA?c RTA?

Lack of control of emotional reactions which result from frustration.

This is an emotionality factor representing a type of behavior characteristic of children who desire attention, who are impatient and demanding, or who are, in less erudite language, spoiled. The factor has been found, however, in college-student groups as well as in children. This is Cattell's <u>Factor D</u>.

Tests with high loadings on this factor:

1. R:Tendency to look for sympathy. BrB-28 (Ei70)

2. R:Forwardness; not timid, modest or retiring.
BrB-34 (Ei69)

3. C:Attention-getting behavior. HJ-15 (Ei68)

4. R:Conceit

BrB-29 (Ei64)

5. R:Quarrelsomeness. BrB-30 (Ei64)

6. C:Over-aggressiveness. HJ-12 (Ei56)

7. C:Bravado.

HJ-17 (Ei50)

8. R:Infantile, demanding, self-centered vs. emotionally mature, adjusting to frustration.

CaA-27 (Ei50,E37,Se28,Pe-27)

9. R:Restlessly, sthenically, hypomanically emotional vs. calm, self-effacing, patient.

CaA-26 (Ei41,E38)

10. R:Demanding, impatient vs. emotionally mature.

CaB-24 (Pe-37,?36,A-35); CaC-24 (Ei30,A-25); SaB-104 (E26+)

FACTOR Ex: Excitement

Analyses: WB?c WH?c Wi WM?c

Rapid shifting of ideas and direction of attention.

This factor has been found separately only in one analysis with abnormal subjects. It may represent the unfavorable end of Factor Pe, but there is no objective evidence for or against this possibility.

Tests with high loadings on this factor:

C:Ideas change with spontaneous rapidity.
 Wi-2 (Ex68); WH-2 (Ma52,?48,?30); WB-1 (?50); WM-1 (?59,Ps35)

2. C:Great variation occurs in rate of speech. Wi-36 (Ex68); WH-36 (?51, Ma32, ?26); WB-18 (?45); WM-18 (?50, Ax41)

3. C:Memory faults. Wi-46 (Ex67, Ma-35, Hy-32), WH-46 (?50, Ma-26)

FACTOR Fe: Fearfulness

Analyses: CaF CM

Subject to chronic fear of dangers in the culture.

Compare with Factor Ax where fear is abnormal in the sense that there is no real danger, no external reference. This factor represents variance in the amount of admitted fear of the continuing dangers that face people. The content of the fear will depend upon the specific continuing circumstances or culture in which the individual finds himself. The factor would be measurable by different items for populations that have been subjected to different influences.

Tests with high loadings on this factor:

- 1. X:Wants America to have more protection from A-bomb. CaF-2 (Fe51, Ix37); CM-18 (Fe49, Ir28)
- 2. X:Wants country threatening America to be destroyed. CaF-9 (Fe49,?-33); CM-19 (Fe45,Sc?45,Ix-27,?26)
- 3. X:Wants to punish those responsible for inflation. CaF-23 (Fe44, Ix38, If-27)
- 4. X:Wants to avoid becoming insane. CaF-7 (Fe37, ?29)
- 5. X:Wants danger of accidents and disease reduced. CM-20 (Fe35, I:427, Ia?-27)

FACTOR G: Intelligence

Analyses: Ab2? CaB CaG TT? SB BrA CaC CEНо BrBCaD Ch Mo? CaA CaE? CSA? OF?

Combination of cognitive aptitude factors.

The symbol G is used advisedly for this factor in order to associate it with Spearman's factor. It represents a combination of the aptitude factors, Verbal, Deductive Reasoning, and probably others. It may also contain personality factors such as Alertness, which could easily affect both intelligence test scores and behavior ratings on intelligence. It is Cattell's Factor B, which he has wisely called Intelligence in the Total Personality.

FACTOR Hy: Hysteria

Analyses: Ey?c Wi CE?c WM WH

Presence or absence of conversion symptoms.

This factor has only been found for abnormal subjects, and could not be found otherwise, unless quite different variables are able to detect it. The identification as Factor E of factors containing the variable Hysteria MMPI may imply that this is a sub-factor of Factor E operating at the extreme unfavorable end of the scale. See Analysis Abl for another possible sub-factor of E at the unfavorable end of the scale.

Tests with high loadings on this factor:

1. C:No organic basis for complaints.
Wi-25 (Hy63); WM-13 (Hy74,Ps25); WH-25 (Hy66) WB-13 (?-30,?26)

2. C:Organic pathology with emotional basis.
Wi-29 (Hy61); WM-16 (Hy68); WH-29 (Hy68); WB-16 (?38)

C:Use made of physical disease symptoms.
 Wi-9 (Hy73); WM-5 (Hy50,Ps50); WH-9 (Hy58); WB-5 (--)

4. C: No concern over physical handicaps. Wi-42 (Hy62); WH-42 (Hy48)

FACTOR Ia: Interest in Athletics

Analyses: CaF GuB CM? RTC

Interest in athletics as spectator or participator.

Separation, if any, between being spectator and participator may well have been missed because of the small number of variables that pertain to this factor. However, the appearance of this as a single factor indicates that the two factors, if they ever can be separated, will be highly correlated.

Tests with high loadings on this factor:

1. X:Likes to take active part in athletics and to get exercise. CaF-1 (Ia69); CM-8 (Ia?49,Fe-25)

2. X:Wants to attend football games and follow the fate of teams. CaF-22 (Ia42,?37); CM-9 (Ia?48)

3. Q:More interested in athletics than in intellectual things.
BT-2 (Ip-47); CaE-37 (G?-38,Ne-27,?-26); GuA-19 (Ip-69,Mf41); GuB-13 (Rh40,Ia35,Ip-25); RTC-13 (Ie40); SaB-37 (Cu?-61,Ip-32,?32,?-30)

4. Q:Becomes absorbed watching athletic contest. RTC-28 (Ia44); GuB-28 (Rh27,Ia25)

FACTOR Ib: Interest in Business

Analyses: CM Lu
Co Sg?
CP ThA
Du

Interest in financial and practical affairs vs. interest in the arts.

Cross-identification of this factor between Analysis Du and Lw is clear, and cross-identification between Analysis CP and ThA is good, but the identification of these two pairs with one another is very dubious and is made on psychological grounds only. Analysis FH should have thrown some light on this, but it did not. In naming this factor Lurie used the term Philistine which puts emphasis on lowness of aesthetic interests. His analysis shows low aesthetic interest with high economic and political interest as well as a separate factor that concerns aesthetic interest. This occurs even though his items do not force low scores in one interest when high scores are received in another as do the Allport Vernon variables used in Analysis Du. Strong's Artist scale has a negative loading on Factor Ib in Analysis ThA, but not in Analysis CP.

It is difficult to know whether or not all of this proves that persons interested in business tend to be disinterested in art, but the evidence seems to weigh in the direction that this is the case. The objection might be raised that subjects tend to differentiate their interests on an inventory, spuriously reducing some of their scores, because they want to indicate clear interest in something else. If this happened, there would be substantial negative correlations between interest inventory scales. That this is not the case is shown in prolished tables of intercorrelations and is demonstrated by the "inventory factors" of Analysis To. On the other hand the positiveness of the correlations may be produced by error variance on the items that overlap the various scales. Let's conclude tentatively, then, that negative factor loadings despite overlapping scales is satisfactory evidence that low interest in something is a real accompaniment of high interest in something else. See also Factor Is for a discussion of type of interest factors.

14. I:Low on Allport-Vernon Aesthetic scale.
Du-3 (Ib40); FH-3 (Ir?47,I1-38)

FACTOR Ic: Interest in Clerical Work

Analyses: Co To

Preference for occupations involving clerical and computational work.

Separation, if any, between clerical and computational interest may well have been missed because of the small number of variables that pertain to this factor, but it may be concluded that, if separated, these would be highly correlated factors. The factor is described above as interest in the occupation rather than interest in the work itself, because for this type of work, it is reasonable to assume that the interest is not in the specific activity but is in the working conditions and associations. See Factor Is for discussion of this point.

Tests with high loadings on this factor:

FACTOR Ie: Interest in Aesthetics

Analyses: Lu To

Interest in the expression of and the appreciation of art.

Separation, if any, between expression and appreciation may well have been missed because of the small number of variables that pertain to this factor, but it may be concluded that, if separated, these would be highly

FACTOR <u>Ie</u> (Continued)

correlated factors. Analysis Lu shows that there is also a tendency to be interested in art in inverse relation to interest in business. See Factor Ib. Factor Ie represents interest in art that is independent of the relationship with interest in business. See Factor Is for a discussion of types of interest factors.

Tests with high loadings on this factor:

- 2. I:Lee and Thorpe's Arts scale.
 To-34 (1e84,?-34,?-31,?27,1s25)
- 3. I:Guilford's Artistic Appreciative scale.
 To-12 (Ie72,?42)
- 4. IJ:Favors aesthetic interests. Lu-9 (Ie64, Tb-59)
- 5. IJ:Favors aesthetic preferences. Lu-ll (Ib-47, Ie45)

FACTOR If: Interest in Family

Analyses: CaF CM

Interest in the welfare of one's family and in assuming the responsibilities of head of the family.

Welfare of parents as well as children is included. Variable 3 suggests independence from the parents. The two analyses present different views of this factor. In Analysis CaF married men are concerned with salary and welfare of country as these affect the family. In Analysis CM the college man yearns for the maturity and associations that bring a wife and family; these include movies, drinking, smoking, and romance.

- 1. X:Wants to keep parents comfortable. CaF-43 (If44, Ir44); CM-3 (If51)
- 2. X:Wants to insure best education for his children. CaF-50 (If48); CM-2 (If40,?-40)
- 3. X:Does not want parent's advice.
 - CaF-5 (Ir-41,?-36,If34); CM-12 (Ir-47,If44,Ib25)
- 4. X:Wants to help children all over the world. CaF-46 (If 42)
- 5. X:Finds America congenial.
 - CaF-42 (If53); CM-1 (Ir-31,Fe29,If--)
- 6. X:Likes to go to movie or play.
 - CaF-30 (Ix54,?37,If--); CM-5 (If50,Cv-35,Ia?32)
- 7. X:Wants to be able to spend more on drinks and smokes. CaF-49 (?56,If--); CM-21 (If 52, Ix36)
- 8. X: Wants to make love to a beautiful woman.
 - CaF-31 (Ix41, If--); CM-6 (If45, Ix42,?-32)
- 9. X:Wants to increase his salary.
 - CaF-18 (If 42,?31, Ix-28); CM-28 (Ib47, Ia?-41, Ix-26, If--)

FACTOR Il: Interest in Linguistic Activities

Analyses: CD Sg FH ThA

Interest in activities where success depends on ability at verbal persuasion vs. interest in other activities.

On the positive side this factor is characterized by the interests of advertising men, authors, and lawyers. It is not clear why Strong's Artist scale should have a positive loading. Possibly the artist's job is to communicate to others through a medium that is not as psychologically distinct from language as we tend to think. On the negative side are a variety of occupational interests including manual, scientific, clerical, and business. It is suggested that a real decrease in these interests accommunics high interest in linguistic activities. See Factor Ib for a discussion of this. See also Factor Is for discussion of types of interest factors.

- I:Strong's Advertising Man scale.

FACTOR Ip: Interest in Philosophizing

Analyses: BT RTC CP? SaB GuA ThB? GuB

Interest in the contemplation and discussion of the serious happenings and problems of life.

This appears to be a factor with some broad effects on interest and habits of participation in social and intellectual activities. It has some behavioristic resemblance to introversion, but there is no evidence of maladjustment, and there is evidence for a positive attitude toward social intercourse: variables 1, 6, 7, and 10 below. The thinking or discussion is stimulated by interest in the solution of philosophically important problems. Compare with Factor Iz.

Tests with high loadings on this factor:

- 1. Q:Interested in serious problems of life and long discussions. CaE-36 (?-28,Re-26,?25); SaB-36 (Ip88,?28)
- 2. Q:Inclined to analyze the motives of others.
 BT-5 (Ip40,SJ-35,Ss27); CaE-35 (Is-31,Re-30,Sf?25); GuA-12 (Ip42);
 GuB-7 (Ip48,Cd?33); RTC-7 (Iz46,Ip38); SaB-35 (Do52,8c-37,Au29)
- 3. Q:Inclined to be introspective.

GuB-26 (Ip57,Cd241), FTC-26 (Ip50, Iz50)

- 4. Q:More interested in intellectual things than in athletics.

 BT-2 (Ip47), CaE-37 (G38,Ne27, 26); CuA-19 (Ip69,Mf-41); GuB-13 (Rh-40,Ia-35,Ip25); RTC-13 (Ia-40,Ip--); SaB-37 (Cu261,Ip32,2-32,230)
- 5. Q:Frequently finds self in a meditative state.
 Gul-16 (Cd?57, Ip47); RTC-16 (Ip49, Iz41, So-26)
- 6. I:Advertising man, lawyer or waiter are more congenial occupations than carpenter, aviator, or real estate salesman.

 CaE-56 (Pe?-35, Is-27, Re-27); SaB-56 (Ip55, Cv-43)
- 7. Q:Likes to discuss more serious questions of life with friends. RTC-22 (Ip40); GuB -22 (Ip39)
- 8. I:Prefers a friend who is interested in thinking about attitude toward life vs. one who is efficient or practical CaE-63 (?28,Re-26); SaB-63 (Ip53)
- 9. Q:Does not want someone with him when receiving bad news. BT-10 (Ip52,Ss43)
- 10. Q:Prefers to take the lead in group activities. GuA-3 (Ip50,So50,Mf29)

FACTOR Ir: Interest in Religion

Analyses: CaF Lu CM SaB FH?

Interest in the spiritual values and ideals of religion as they satisfy the individual's need for security or other personal needs.

FACTOR Ir (Continued)

This factor is contrasted to Factor Jr, Attitude toward Religion, by Analysis SaB. Although both pertain to religion, the two factors are quite different. Factor Ir pertains to religion as it fills the individual's need for the feeling of security that proceeds from faith in a divine power.

Tests with high loadings on this factor:

- 1. X:Wants to feel in touch with God or a principle giving help. CaF-44(Ir67); CM-11(Ir53, Ix-29, Cv-28)
- 2. IJ: Favors religious ideals.

Lu-22(Ir69,?-32)

- 3. J:Not annoyed by unintentionally disagreeable acts. CaE-79(?-69,Pe?52,?-40,?37); SaB-79(Ir63,Re-36,Cv26)
- 4. I:Church should convey spiritual worship vs. bring out morality and charity.

 CaE-54(?46,Ss34,Ne-33,Re30,?28,?-27,?26); SaB-54(Ir62,Ne-50)
- 5. X:Wants parents' advice and to heed their wishes. CaF-5(Ir41,?36,If-34); CM-12(Ir47,If-44,Ib-25)
- 6. I:Would prefer lecture on religious faiths vs. government. CaE-60(G?-36,?-35,?-35,Se?25); SaB-60(Ir56,Re34)
- 7. X:Wants to see organized religion maintain or increase its influence. CaF-19(Ir62); CM-14(If-37,?32,Ir26)
- 8. I:Prefers spouse to be spiritual or artistic vs. successful or admirable. CaE-59(Ss30,?-30,?28); SaB-59(Ir52,Ip47)
- 9. IJ:Does not favor economic beliefs.

Lu-8(Ir47,?-42, Tb-35)

- 10. I:Prefers article on protestant leaders vs. market conditions. CaE-53(Se?59,G?-54,?-45); SaB-53(Ir44,Ss27,?44)

FACTOR Is: Interest in Science

Analyses: CaE Du? SaB?c Co FH Sg CP Lu ThA

Interest in scientific or related fields vs. interest in business.

Physical science, medicine, psychology, architecture, and engineering are included on the positive side of the factor with some business variables on the negative side. See <u>Factor Ib</u> for a discussion of the negative side of an interest factor.

In all of these interest factors there arises the problem of whether there exists interest in a subject matter or interest in some other aspect of an occupation. If occupations with high loadings are distinguishable from those with low loadings, primarily because they deal with different subject matter, it is reasonable to say that interest is in the subject

FACTOR Is (Continued)

matter. On the other hand, if occupations with high loadings are distinguishable primarily because of the nature of the working conditions, personal associations, or other characteristics of the occupations, it is reasonable to say that the interest is not in the subject matter, but in whatever is common to the occupations with high loadings. For <u>Business</u>, <u>Philosophizing</u> and <u>Science</u>, the interest seems to be in the subject matter; for <u>Family</u>, <u>Religion</u>, <u>Sex</u> and <u>Social Welfare</u>, it seems to be in a goal, for <u>Athletics</u>, <u>Aesthetics</u>, <u>Linguistic Activity</u>, and <u>Puzzles</u>, it seems to be in the activity itself; for <u>Clerical Work</u>, it is probably satisfaction with the occupation as one providing the most satisfactory working conditions and the least unpleasant work.

Where interest scales are developed by try-out with a group of persons of a given occupation, the scale represents interests characteristic of persons within the occupation rather than interest in some aspect of the occupation It will be assumed, however, that the interests which distinguish an occupational group reflect an interest in some aspect of the occupation itself.

- 2. I:Low on Strong's L.I. Salesman scale. CD-6(Il42, Iw-29, Is27, Gs26), CP-11(Is79,?-32, Ib-29); FH-8(Is93, Ir?-28); Sg-31(Il-67, Is53,?-38); ThA-10(Is82, Ib-45, Iw-27)

FACTOR <u>lw</u>: Interest in Social Welfare

Aralyses: CD FH ThA
Co Lu To?
CP?c Sg

Interest in contributing to the happiness of others.

This factor combines a considerable variety of occupations and scales the common element of which is the goal of helping others. Ordinarily this book considers Strong's scales for men and women to be parallel where the scales have the same name. However, Strong's Lawyer scale is included in the list below (variable 5) even though it appears on this factor only in Analysis CD where the subjects were women. The implication is that Interest in Social Welfare motivates lady lawyers while Interest in Linguistic Activity motivates men lawyers. See also Factor Is for discussion of types of interest factors.

Tests with high loadings on this factor:

2. I:Strong's Social Science Teacher scale. CD-10(Iw78,Gs38,I132); Sg-20(Iw76,Is-58)

I:Strong's Minister scale.

FACTOR Iw (Continued)

- 10. I:Low on Kuder Artistic scale. Co-25(Iw52,Ic32,Ib29)
- 11. IJ:Favors aesthetic ideals. Lu-10(Iw51)
- 12. IJ:Favors social ideals. Lu-14(Iw49,?39)

FACTOR Ix: Interest in Sex

Analyses: BC CaF

Need for satisfaction of the sexual drive.

All subjects in these analyses were men; those of Analyses BC and CM were in college, those of Analysis CaF were married or engaged.

Tests with high loadings on this factor:

- Q:Questionnaire on sex predation. BC-11(Ix52,Do29)
- 2. X:Wants to make love to beautiful woman. CaF-31(Ix41); CM-6(If45,Ix42,?-32)
- 3. Q:Questionnaire on anti-feminine feelings (woman's place is in home). BC-22(Ix50,?34,?30,Do26)
- 4. X:Likes sex appeal in a woman. CM-7(Ix49,?-42, Tb-27)
- 5. Q:Questionnaire on sex drive. BC-21(Ix45,Do29,?-26)
- 6. X:Wants more attractive restaurants around town. CaF-24(Ix34,?29)
- 7. X:Wants to travel to unknown corners of the earth. CaF-32(Ix33)
- 8. I:Likes to go to good movie or play every week or so. CaF-30(Ix54,?37); CM-5(If50, Cv35, Ia?32, Ix--)

FACTOR Iz: Interest in Puzzles

Analyses: GuB RTC

Liking for thinking out problems for its own sake.

This was called <u>Liking Thinking</u> by Cuilford. Interest here is in the puzzles as a game where the ability to think is challenging or competitive. In both analyses listed it may be compared with <u>Factor Ip</u>, <u>Interest in Philosophizing</u>. (It should be remembered here that <u>Analyses GuB</u> and <u>PTC</u> are merely different rotations of the same data.)

FACTOR Iz (Continued)

Tests with high loadings on this factor:

- 1. Q:Enjoys thinking out complicated problems. GuB-25(Iz64,Ip29); RTC-25(Iz60,Mp-43)
- Q:Likes to try wits in solving puzzles. GuB-23(Iz61); RTC-23(Iz31,Mp-29,?27)

FACTOR Lo: Loneliness

Analyses: CaE?c Mo SaB?c

Tendency to feel lonely even with other people.

Only in Analysis Mo was this factor found separately from Factor Cd, Cycloid Tendency. The figure shows the plot of Factors Lo and Cd in Analysis Mo. The trait, Depression, appears as a combination of these two factors. It seems likely, however, that there are other types of depression than the one stemming from this particular combination.

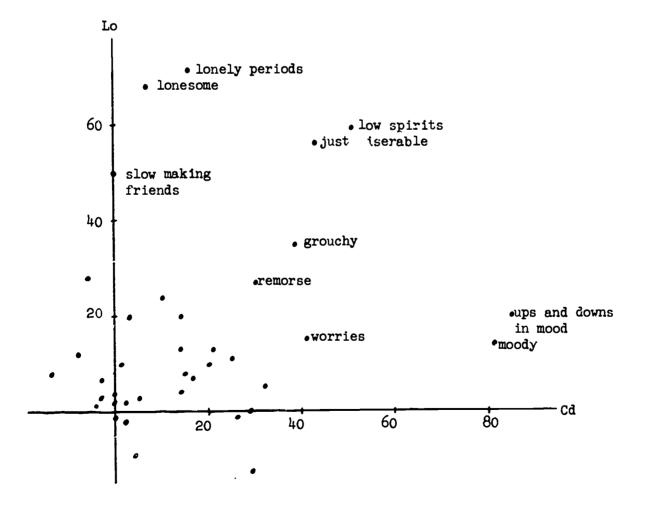

Figure. Plot of Factors Lo and Cd for Analysis Mo.

FACTOR Lo (Continued)

Tests with high loadings on this factor:

 Q:Often experiences periods of loneliness. Mo-30(Lo71,Au49)

2. Q:Often feels lonesome with people BT 12(Au48,Gs-44); CaE-8(?76); CSA-17(?61); Mo-4(Lo68,Au47); SaB-8(?60,Ip36,Au26,?26)

3. Q:Frequently in low spirits. Mo-29(Lo59,Cd51)

FACTOR Ma: Mania

Analyses: WB?c

WH

Wi

WM

Exaggerated activity and emotions.

This factor has been identified only with abnormal subjects. It coincides probably with the manic phase of manic-depressive psychosis. It may represent merely an abnormal extension of Factor Su, Surgency.

Tests with high loadings on this factor:

C:All overt activity is not at a minimum.
 WB-17(?29,?-26); WH-32(Ma50,?-34); Wi-32(Ma74); WM-17(Ma59)

2. C:Does not avoid people.

WB-7(?54); WH-13(Ma50,?-31,Ax-30); Wi-13(Ma54,Hy25); WM-7(Ma67,Ax-26)

3. C:Does not give in easily to others.

WB 3(?46); WH-6(Ma43); Wi-6(Ma59), WM-3(Ma58, Hy-37)

4 C:Temper tantrums.

WB-6(?70), WH-12(Ma60,?27,Ps26); Wi-32(Ma56); WM-6(?54,Ma45,Ps41)

5. C:Shouts, sings, talks loudly.

WB-8(?68), WH-14(Ma69,?33,?25); Wi-14(Ma46,Ex33, Dt26); WM-8(?64, Ma39,Ps34)

6. C:Can make decisions.

WH-43(?-53, Ma40, ? 25); Wi-43(Ma68)

7. C:No failures of affective response.

WH-41(Ma43,? 33,? 29); Wi-41(Ma61,Dt-28)

8. C:Dramatically attention demanding WH-31(Ma49), Wi-31(Ma54,?46,Hy25)

9. C: Exaggeration of ability and well-being.

WH-20(Ma61,?36), Wi 20(?37,Ma36)

10. C:Exaggerated affective expressions, WH-54(Ma60,?27), Wi-54(Ps32,Hy31,Ma26,Dt26)

FACTOR Me: Meticulousness

Analyses: BC Bo

Tendency toward excessive carefulness with details.

It is possible that this is the same factor as <u>Factor C</u>, <u>Carefulness</u>, described in <u>Psychometric Monograph</u>, No. 5, as the tendency not to make errors on speeded tests where the individual items are of trivial difficulty.

Tests with high loadings on this factor:

- 1. Q:Orderliness questionnaire. BC-23(Me73,Ei?29)
- 2. Q:Meticulousness questionnaire. BC-14(Me61,De?-29)
- R:Personal appearance.
 Bo-2(Me57, J?38, ?34, A26)
- 4. R:Thoroughness.
 Bo-4(De57,Me50,?39)

FACTOR Mf: Masculinity vs. Femininity

Analyses: CaE? FT1 Ko
Co FT2 ThB?
CSA Gi?c Ty
CW GuA

Masculine vs. feminine interests, preferences, and behavior patterns.

Since there are differences between men and women in a tremendous variety of activities, it should be clear that the list below by no means represents the most important differences that exist. Many of the items in the list are ones that are found in other factors. It can be considered that this factor represents variance caused by the biological and environmental differences between the sexes, and that the other factors represented in this list reflect the variance that exists within sex. Such factors, of course, must correlate to some degree with Factor Mf. In studying the nature of this factor, it should be noted that, in 5 out of 8 of the analyses where the factor was identified with confidence, the identification was primarily based upon the "Masculinity-Femininity" scale of a published instrument. In none of these 5 cases was sex itself a variable.

- 2. I:Kuder's Masculinity-Femininity scale.
- Co-30(Mf82,?41)

 R:Boorish, Clumsy, Awkward, Practical, Logical.

 CSA-14(Mf82,Pe?-50,E?39)

FA: OR Mp: Impulsiveness

Analyses: GuB

La

RTC

Tendency to act before adequate consideration of the action can be made.

In Analyses RTC and GuB (analyses using the same data) the variables with highest loadings on this factor are also heavily loaded with Factor Rh, Rhathymia. An oblique rotation (unpublished) made by D. R. Saunders of the data of Analysis GuB shows a correlation between the reference vectors for Factors Rh and Mp of -.51 which indicates the highest correlation he found between any two of the factors in that study.

- 1. Q:Does not usually plan out work carefully before beginning it. La-3(Mp58)
- 2. Q:Not inclined to stop and think before acting.
 GuB-20(Rh55,Mp35); GuC-8(Su36,Pe-34); RTC-20(Mp46,Ip-42,?34,Rh30);
 RTD-8(Su34,Rh32)

FACTOR Mp (Continued)

3. Q:Rates self as impulsive.

GuB-14(Rh47,Mp38,So28); RTC-14(Mpl0,Rh33,Ip-29)

4. Q:Often says things on the spur of the moment and then regrets it. La-4(Mp48,Cd25)

FACTOR Ne: Nervousness

Analyses: CaE La

FK? RTD

GuC SaB

Emotional hyper-sensitivity to exciting, distracting, or sudden stimuli.

This characteristic is coloquially called jumpiness or touchiness. It is distinguished from Factor E in that it pertains to extent of emotional reaction to a stimulus rather than to the general level of emotionality. It is not concerned with reaction to frustration as is Factor Ei.

Tests with high loadings on this factor:

1. Q:Rattled easily in exciting situations. CaE-5(Ne48); GuA-35(Cd39,Mf-38); La-33(Ne59,Sn33,Sc-30,Cd26); SaB-5(Ne50,E44,Sc-25)

2. Q:Does not keep emotions under good control. CaE-23(Ne52,?31,?-30); SaB-23(Ne47,?44)

3. Q:Easily startled by unexpected stimuli.

CaE-30(?-35,Ne--); GuC-7(Ne51); RTD-7(Ne41,E?28); SaB-30(Ne52,Au37)

4. Q:Easily disturbed by distracting stimuli while doing mental work. GuC-4(Ne57,Pe-25); RTD-4(Rh-38,E?31,Ne28)

5. Q:Bothered by having an unfinished job on his hands. Ia-41(Ne55)

6. Q:Often in a state of excitement.

La-32(Ne55,E40,Sn25); Mo-23(E42,Au34,Cd29)

7. Q:Draws or writes notes at a lecture. RTD-14(Ne36, Pe-28); GuC-14(Ne42)

FACTOR Pc: Psychotic Tendency

Analyses: Abl Co Ty
Ab2?c CW?c WLl
CaE? Ey WL2
CE LW?

Combination factor of tendency toward mental disturbance of the schizophrenic, manic depressive, and perhaps, other types.

This factor has been identified in both normal and abnormal groups. It may be a combination of factors such as \underline{Ax} , \underline{Dt} , \underline{Hy} , \underline{Ma} , and \underline{Ps} . Although many of these may be relatively independent in a group of abnormal subjects,

FACTOR Pc (Continued)

the correlation between them becomes substantial when the group is sufficiently heterogeneous. Furthermore, when an analysis includes only a few variables concerned with seriously abnormal reactions, there is no opportunity for the other factors to separate.

Tests with high loadings on this factor:

Co-34(Pc67), MD-11(E74,So?31)

•	\mathtt{BrA}	CaD?	Kr?	SaB
	CaA	CSA?	La	Stl?
	CaB	GuC	RTA	Ts?

Willingness and ability to stick at a task or a type of work.

Most of the variables make no distinction between the various possible reasons for not sticking to a task, and so the universality of this factor is not adequately proven. The few exceptions to this are no. 4 in the list below

FACTOR Pe (Continued)

where obstacles are mentioned and nos. 11, 15, 17, and 18 where specific tasks were set up in test situations. Variables 1 and 2 might imply that not wanting to change tasks is prompted by inability to shift set, but the other variables on the factor are such as to indicate that these two were interpreted by most subjects as not wanting to change tasks because of restlessness. In the case of most factors, cross identification between analyses using different media is done merely on psychological grounds. This factor, however, presents a good example of where one analysis (SaB) served well in linking the media R and Q. Of pertinence here are Analyses Rel and TG2 of Psychometric Monograph, No. $\overline{5}$, where sticking to two different verbal tasks and some perseverational effects fell on a factor identified as Pe. It seems reasonable to believe that this is the same Factor Pe. It is Cattell's Factor G.

- 1. Q:Does not like work where task is changed frequently. GuC-13(Pe81); RTD-13(Pe72)
- 2. Q:Does not like to change from one type of work to another frequently. GuA-l1(--); GuC-3(Pe80); RTD-3(Pe73)
- R:Persevering, determined vs. quitting, fickle.
 CaB-17(Pe55, Do?31); CaC-17(Pe57, G26, A25); SaB-97(Pe54+)
- 4. R:Does not abandon tasks in face of obstacles.
 RTA-18(Pe79)
- 5. Q:Does not prefer a job that offers constant change, travel, and variety. CaE-28(Pe?49,?29); SaB-28(Pe64,Re-31)
- 6. R:Does not abandon tasks from mere changeability.
 RTA-19(Pe71)
- 7. R:Does not tend to oscillate between cheerfulness and depression. RTA-2(Pe71)
- 8. R:Responsible vs. frivolous. CaB-6(Pe39,So?-31,?-30); CaC-6(Pe48); SaB-86(Pe44+,E-22)
- 9. Q:Does not have a craving for excitement. CaE-27(Pe?48,Se?33); SaB-27(Pe53,Su-34)
- 10. R:Insistently orderly vs. relaxed, indolent. CaB-20(G45,Pe28); CaC-20(Pe47); SaB-100(Pe45+)
- 11. T:Picture inhibition persistence.

BaB-7(Su54)

14. R:Enthusiastic.
Ba3-8(Su53)

FACTOR Wi: Will Control vs. Suggestibility and Perseveration

Analyses: BrA Kr CaD? RTB? CSA?

Voluntary control over behavior in the face of either opposing suggested activities or perseverative tendencies.

This factor is probably the one frequently referred to in the literature as Webb's "w" factor, see Analysis RTA. It is evidently the inverse of Factor Pn in Psychological Monograph, No. 5, found by Rethlingshafer (see Factor Pe). The name was changed from perseveration, because that is too limited a concept to fit the variables with high loadings on this factor.

Tests with high loadings on this factor:

1. R:Does not do what others do for the sake of doing it. Kr-9(Wi68, Ei?-29)

FACTOR Wi (Continued)

- 2. T:Time spent on word-building test.
 Kr-4(Wi56,Pe?25)
- 3. T:Resistence to suggestion: a variety of tests combined.
 BrA-5(Wi53)
- 4. T:Time spent on coding test instead of going to playground.

 Kr-5(Wi53)
- 5. R:Is not easily led by others. Kr-18(Wi52)
- 6. T:S Perseveration Test, low perseveration.
 BrA-21(Wi46, Pe-27)
- 7. T:V Perseveration Test, low perseveration. BrA-22(Wi38, Pe-33, Ho-26)

SUPPLEMENTARY FACTOR LIST

This is a list of factors whose interpretation is possible, but which have not been described fully, because they have been identified in one analysis only. Aptitude factors found in single (or several) analyses are not included in this list, but are named or made reference to in footnotes to the tables of loadings. The letters following the factor names are the code letters of the analysis in which they were identified. The factor names used in this list, as in the case of all factor names used in Part II, represent interpretations of the writer which try to be most helpful in the light of all the literature covered, but which are not necessarily the same as those made by the authors of the analyses.

INDEX I

VARIABLES

All of the variables used in the analyses covered by this survey are listed here. Where the variable has a name, the name is used. Where the variable is a questionnaire item, it is listed under one or more of the most specific or characteristic words or phrases in the item. For multi-scaled inventories there is an entry for each scale as well as for the name of the inventory. The code letters or numbers following the variable's name correspond with those in Part I associated with the variable descriptions and the variable factor loadings. In cases where the variable is used in Part II to describe one or more of the factors, the word Factor and the code letters of the factor are given. In such cases the full summary of loadings can be found by finding the variable in the list under the factor indicated. The key to the factor code letters is the Table of Contents for Part II. In cases where the index entry is combined with other measures in the variable a small c follows the code designation.

INLEX II

NAMES

This index contains the names of authors and junior authors responsible for analyses that are either fully covered in this survey or included in the Supplementary Analysis List. Names mentioned in the survey only as inventory or test authors are listed in Index I only. For each name, reference is made by code designation to the analysis or other place where the name appears.
